#### Abstract

Allylamines, readily accessible by ene reactions of $N, N$-dibenzyliminium pentachlorostannates with 1,3-enynes, undergo domino reactions with maleic anhydride or maleic imide to give cisfused hexahydroisoindolones, which were characterized by x-ray analysis.

Keywords: Diels-Alder reactions, isoindolones, lactams, stereoselectivity, x-ray analysis

## Introduction

The reactions of iminium ions with alkynes provide a general access to allylamines. ${ }^{1-3} \mathrm{~N}, \mathrm{~N}$ dibenzylmethyleneammonium ions $\mathbf{1}$, for example, undergo ene reactions with inverse electron demand with mono- and disubstituted acetylenes $\mathbf{2}$ to yield the iminium ions $\mathbf{3}$ which hydrolyze with formation of the N -benzyl protected allylamines 4 (Scheme 1 ). ${ }^{2}$

## Scheme 1

Though ene reactions of iminium ions with CC-double bonds have also been reported, ${ }^{4,5}$ CCtriple bonds are more reactive with the consequence that conjugated enynes $\mathbf{5}$ can selectively be converted into the corresponding dienylamines 6 (Equation 1). ${ }^{2}$

We now report that the reactions of the dienylamines 6, thus readily available, with maleic anhydride and maleic imide provide a straightforward access to partially hydrogenated N -benzyl-3-oxoisoindolone-4-carboxylic acid derivatives $7,{ }^{6,7}$ a building block of a variety of natural products ${ }^{8,9}$ and biologically active compounds. ${ }^{10-12}$

## Results

Heating equimolar amounts of the 2,4-dienylamine $\mathbf{6 a}$ with maleic anhydride or maleic imide in toluene gave rise to the formation of the bicyclic lactams rac-8 and rac-9, respectively. The moderate yields of both reactions given in Scheme 2 were mainly caused by the consecutive crystallization procedure, and no attempt of optimization was undertaken.

Scheme 2

Vicinal coupling constants of $J_{3 \mathrm{a}, 7 \mathrm{a}}=6.8 \mathrm{~Hz}$ and 6.6 Hz were observed in the ${ }^{1} \mathrm{H}$ NMR spectra for the lactams $\mathbf{8}$ and 9 , respectively, and additional 2D NMR experiments indicated the formation of cis-fused ring systems. In order to unequivocally establish the molecular structures of $\mathbf{8}$ and $\mathbf{9}$, crystals suitable for X-ray structure analysis were grown from ethyl acetate/petroleum ether mixtures. The ZORTEP plots in Figures 1 and 2 clearly demonstrate the cis-ring junction in both lactams rac-8 and rac-9.

Figure 1. ZORTEP plot of $\mathbf{8}$.

Figure 2. ZORTEP plot of $\mathbf{9}$. The intramolecular hydrogen bond between N2 and O 1 is shown by a dashed line.

The crystal structure of 9 reveals the presence of intermolecular hydrogen bonds between the free amido groups with O2-N2A distances of 288.9 pm. Further, a stronger intramolecular hydrogen bond between N2 and O1 (279.4 pm) can be found (Figure 2) which also persists in $\mathrm{CDCl}_{3}$ solution and gives rise to separate NMR resonances at $\delta 5.64$ and 9.10 for the protons of the $-\mathrm{NH}_{2}$ group.

In the crystal structure of the analogous lactam 8 that carries a -COOH group, intramolecular hydrogen bonds could not be observed. However, intermolecular O-H - O hydrogen bonds also play an important role in the solid state of $\mathbf{8}$ and induce the pairing of enantiomers as shown in Figure 3.

Figure 3. Intermolecular hydrogen bonding pattern in the crystals of racemic $\mathbf{8}(d(\mathrm{O} 1-\mathrm{O} 3 \mathrm{~A})=$ 265.8 pm ).

In an analogous reaction of $\mathbf{6 b}$ with maleic anhydride, the silylated bicyclic lactam rac-10 was obtained (Scheme 3). Though the quality of the crystals was not high enough for an X-ray analysis, the cis-fusion of the carbon skeleton could clearly be derived from the NOESY spectrum which showed signal enhancements for $1-\mathrm{H}(\delta 3.42)$, $3 \mathrm{a}-\mathrm{H}, 4-\mathrm{H}$, and $7-\mathrm{H}$ when the protons of the trimethylsilyl group were irradiated.

## Scheme 3

The reactions of the dienylamine $\mathbf{6 c}$ with maleic anhydride and maleic imide yielded the tricyclic lactams rac-11 and rac-12, respectively (Scheme 4). The cis-annelation of the lactam and the cyclohexene ring was already indicated by the small vicinal coupling constant of $J_{3 \mathrm{a}, \mathrm{9a}}=$ 6.3 Hz that was found in the ${ }^{1} \mathrm{H}$ NMR spectrum of $\mathbf{1 2}$. Furthermore, the X-ray analysis of crystals of $\mathbf{1 2}$ that precipitated from a ethyl acetate/petrolem ether mixture proved that all protons of the central six-membered ring are located at the same face which gives rise to a bowl-shaped molecular structure (Figure 4). This finding is in accord with the observations by Crisp and Gebauer ${ }^{7}$ who reported analogous reactions of chiral dienylamines with maleic anhydride.

## Scheme 4

Similar to the molecular structure of $\mathbf{9}$, the interatomic distance of 276.2 pm indicates the presence of an intramolecular hydrogen bond between the lactam oxygen O 1 and the amido nitrogen N2 of 12. Furthermore, each of the $-\mathrm{CONH}_{2}$ groups is involved in a weaker intermolecular hydrogen bond ( 296.1 pm ) between N 2 and O2A. In agreement with the properties in the solid state, the ${ }^{1} \mathrm{H}$ NMR signals of the two protons bound to N 2 are observed at chemical shifts that differ by 4.10 ppm .

Figure 4. ZORTEP plot of $\mathbf{1 2}(d(\mathrm{O} 1-\mathrm{N} 2)=276.2 \mathrm{pm})$.

## Discussion

The isoindolone derivatives $\mathbf{8} \mathbf{- 1 2}$ which could be isolated in moderate yields from the reactions of maleic acid or maleic imine with dienylamines uniformly showed cis-annelation of the lactam ring to the adjacent cyclohexenyl ring though the presence of smaller amounts of trans-annelated products in the crude reaction products cannot be excluded. This observation contrasts the report by Mellor and Wagland ${ }^{6}$ who described that the reaction of maleic anhydride with N-benzyl-hexa-2,4-dienylamine in toluene gave rise to the formation of a trans-fused hexahydroisoindolone (yield: $82 \%$ ) with a coupling constant of $J_{3 \mathrm{a}, 7 \mathrm{a}}=12.5 \mathrm{~Hz}$.

Because Diels-Alder reactions generally show preference for the formation of endoproducts, ${ }^{13}$ the observed cis-fusion of the bicyclic ring system in $\mathbf{8 - 1 2}$ can be rationalized by the two different reaction paths A and B in Scheme 5.

## Scheme 5

Crisp and Gebauer demonstrated that Cbz-protected allylamines are not capable of attacking maleic anhydride. Therefore, they concluded that in the reactions of Cbz-protected dienylamines with maleic anhydride, the intermolecular Diels-Alder reaction precedes the N -attack on the anhydride, as suggested by path A in Scheme 5. ${ }^{\text {7a }}$

The situation is different for the N -benzyl substituted allylamines used in this work: When a solution of equimolar amounts of dibenzylamine (14) and maleic anhydride in $d_{8}$-toluene was kept at $20{ }^{\circ} \mathrm{C}$ for 15 min and analyzed by ${ }^{1} \mathrm{H}$ NMR, ${ }^{14}$ quantitative conversion into amide $\mathbf{1 5}$ was observed (Scheme 6).

## Scheme 6

As the corresponding intermolecular Diels-Alder reactions are considerably slower (4 d at $25^{\circ} \mathrm{C}, 12 \mathrm{~h}$ at $\left.40^{\circ} \mathrm{C}\right)^{7 \mathrm{a}}$ we can rule out path A as a major pathway in the domino reactions ${ }^{15}$ of the N-benzyl-substituted dienylamines with maleic anhydride. Because of the lower electrophilicity of maleic imide, the sequence of the two reaction steps may be different from the reactions with maleic anhydride.

## Experimental Section

General Procedures. Dienylamines $\mathbf{6 a - c}$ were prepared as described before. ${ }^{2}$ Maleic anhydride (> 99\%, Fluka) and maleic imide (> $98 \%$, Merck) were used as purchased.
${ }^{1} \mathrm{H}$ NMR spectra (300, 400, or 600 MHz ) and ${ }^{13} \mathrm{C}$ NMR spectra ( 75.5 or 100.6 MHz ) refer to $\mathrm{CDCl}_{3}\left(\delta_{\mathrm{H}} 7.24 \mathrm{ppm}, \delta_{\mathrm{C}} 77.00 \mathrm{ppm}\right.$ ). DEPT experiments were used to obtain information about the multiplicity of the ${ }^{13} \mathrm{C}$ resonances. Mass spectra ( 70 eV , EI) were obtained on a Finnigan MAT 95 Q.

2-Benzyl-6-methyl-3-oxo-2,3,3a,4,5,7a-hexahydro-1H-isoindole-4-carboxylic acid (8). A solution of $\mathbf{6 a}(2.62 \mathrm{~g}, 14.0 \mathrm{mmol})$ and maleic anhydride ( $1.25 \mathrm{~g}, 12.7 \mathrm{mmol}$ ) in toluene ( 20 mL ) was heated to reflux for 4 h . Removal of the solvent in vacuo yielded 3.78 g of a red viscous liquid oil. The crude product crystallized from a mixture of ethyl acetate and petroleum ether ( $1 / 1, \mathrm{v} / \mathrm{v}$ ) to give $\mathbf{8}(1.82 \mathrm{~g}, 50 \%)$ as colorless crystals; mp $161-163^{\circ} \mathrm{C}$.
NMR data: $\delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right) 1.71\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 2.17-2.41\left(\mathrm{~m}, 2 \mathrm{H}, 5-\mathrm{H}_{2}\right), 2.84-2.95(\mathrm{~m}, 2$ $\mathrm{H}, 4-\mathrm{H}$ and $7 \mathrm{a}-\mathrm{H}), 2.91\left(\mathrm{~d},{ }^{2} J=10.1,1 \mathrm{H}, 1 / 2 \times 1-\mathrm{H}_{2}\right), 3.32(\mathrm{dd}, J=6.8, J=2.9,1 \mathrm{H}, 3 \mathrm{a}-\mathrm{H}), 3.53$ (dd, ${ }^{2} J=10.0, J=6.2,1 \mathrm{H}, 1 / 2 \times 1-\mathrm{H}_{2}$ ), 4.31, $4.59\left(2 \mathrm{~d}\right.$, each $\left.{ }^{2} J=14.9,2 \times 1 \mathrm{H}, \mathrm{PhCH}_{2}\right), 5.12(\mathrm{~s}$, $1 \mathrm{H}, 7-\mathrm{H}), 7.11-7.33(\mathrm{~m}, 5 \mathrm{H}, \mathrm{Ph}), 12.15(\mathrm{br} \mathrm{s}, \mathrm{COOH}) . \delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}, 75.5 \mathrm{MHz}\right) 23.4\left(\mathrm{q}, \mathrm{CH}_{3}\right)$, 29.1 (t, C-5), 34.1 (d, C-7a), 41.3, 41.4 (2 d, C-3a and C-4), 46.6 (t, PhCH2), 52.0 (t, C-1), 121.0 (d, C-7), 127.67, 127.73, 128.6 (3 d, Ph), 134.9, 136.5 ( $2 \mathrm{~s}, \mathrm{Ph}$ and C-6), 175.2, 175.4 (2 s, COOH and CO). Signal assignments are based on ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}-\mathrm{COSY}$ and NOESY experiments. Anal. Calcd. for $\mathrm{C}_{17} \mathrm{H}_{19} \mathrm{NO}_{3}$ (285.34): C, 71.56; H, 6.71; N, 4.91. Found: C, 71.46; H, 6.77; N, 4.94.
2-Benzyl-6-methyl-3-oxo-2,3,3a,4,5,7a-hexahydro- $\mathbf{H}$-isoindol-4-carboxamide (9). A solution of $\mathbf{6 a}(2.62 \mathrm{~g}, 14.0 \mathrm{mmol})$ and maleic imide ( $1.36 \mathrm{~g}, 14.0 \mathrm{mmol}$ ) in toluene ( 20 mL ) was heated to reflux for 4 h . Removal of the solvent in vacuo yielded 3.98 g of a red viscous oil. The
crude product crystallized from a mixture of ethyl acetate and petroleum ether ( $1 / 1, \mathrm{v} / \mathrm{v}$ ) to give 9 ( $2.27 \mathrm{~g}, 57 \%$ ) as colorless crystals; mp $131-134{ }^{\circ} \mathrm{C}$.
NMR data: $\delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) 1.72\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 2.23-2.41\left(\mathrm{~m}, 2 \mathrm{H}, 5-\mathrm{H}_{2}\right), 2.69-2.74(\mathrm{~m}, 1$ H, 4-H), 2.87 (d, ${ }^{2} J=9.8,1 \mathrm{H}, 1 / 2 \times 1-\mathrm{H}_{2}$ ), 2.91 (br s, $1 \mathrm{H}, 7 \mathrm{a}-\mathrm{H}$ ), 3.17 (br d, $J=6.6 \mathrm{~Hz}, 1 \mathrm{H}, 3 \mathrm{a}-$ H), $3.46\left(\mathrm{dd},{ }^{2} J=9.6, J=6.1,1 \mathrm{H}, 1 / 2 \times 1-\mathrm{H}_{2}\right), 4.29,4.56\left(2 \mathrm{~d}\right.$, each $\left.{ }^{2} J=14.9,2 \times 1 \mathrm{H}, \mathrm{PhCH} H_{2}\right)$, 5.10 (s, $1 \mathrm{H}, 7-\mathrm{H}$ ), 5.64 (br, $1 \mathrm{H}, 1 / 2 \times \mathrm{CONH}_{2}$ ), $7.12-7.33$ (m, $5 \mathrm{H}, \mathrm{Ph}$ ), 9.10 (br, $1 \mathrm{H}, 1 / 2 \times$ $\left.\mathrm{CONH}_{2}\right) . \delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}, 100.6 \mathrm{MHz}\right) 23.3\left(\mathrm{q}, \mathrm{CH}_{3}\right), 30.7(\mathrm{t}, \mathrm{C}-5), 35.3(\mathrm{~d}, \mathrm{C}-7 \mathrm{a}), 42.1(\mathrm{~d}, \mathrm{C}-3 \mathrm{a})$, 43.6 (d, C-4), 46.5 (t, PhCH2), 51.3 (t, C-1), 121.5 (d, C-7), 127.6, 127.7, 128.5 (3 d, Ph), 135.6, 137.4 ( 2 s , Ph and C-6), 174.2, 177.0 ( $2 \mathrm{~s}, \mathrm{CONH}_{2}$ and CO). Signal assignments are based on ${ }^{1} \mathrm{H},{ }^{1} \mathrm{H}-\mathrm{COSY}$ and HETCOR experiments. Anal. Calcd. for $\mathrm{C}_{17} \mathrm{H}_{20} \mathrm{~N}_{2} \mathrm{O}_{2}$ (284.36): C, 71.81; H, 7.09; N, 9.85. Found: C, 71.48; H, 6.98; N, 9.72.

2-Benzyl-6-methyl-3-oxo-7a-trimethylsilyl-2,3,3a,4,5,7a-hexahydro- $\mathbf{1 H}$-isoindol-4-carboxylic acid (10). A solution of $\mathbf{6 b}(3.88 \mathrm{~g}, 15.0 \mathrm{mmol})$ and maleic anhydride ( $1.33 \mathrm{~g}, 13.6 \mathrm{mmol}$ ) in toluene ( 20 mL ) was heated to reflux for 4 h . Removal of the solvent in vacuo yielded 3.55 g of a red viscous oil. The crude product crystallized from a mixture of ethyl acetate and petroleum ether ( $1 / 1$, v/v) to give $\mathbf{1 0}$ ( $3.17 \mathrm{~g}, 65 \%$ ) as colorless crystals; mp $153-155{ }^{\circ} \mathrm{C}$.
NMR data: $\delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right) 0.06\left(\mathrm{~s}, 9 \mathrm{H}, \mathrm{SiMe}_{3}\right), 1.75\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 2.26-2.47(\mathrm{~m}, 2 \mathrm{H}, 5-$ $\mathrm{H}_{2}$ ), 2.85-2.91(m, $\left.1 \mathrm{H}, 4-\mathrm{H}\right), 2.89\left(\mathrm{~d},{ }^{2} J=9.9,1 \mathrm{H}, 1 / 2 \times 1-\mathrm{H}_{2}\right), 3.20(\mathrm{~d}, J=2.5,1 \mathrm{H}, 3 \mathrm{a}-\mathrm{H}), 3.42$ (d, ${ }^{2} J=9.7,1 \mathrm{H}, 1 / 2 \times 1-\mathrm{H}_{2}$ ), 4.18, $4.75\left(2 \mathrm{~d}\right.$, each ${ }^{2} J=15,2 \times 1 \mathrm{H}, \mathrm{PhCH}$ ), 5.04 (s, $1 \mathrm{H}, 7-\mathrm{H}$ ), $7.11-7.43(\mathrm{~m}, 5 \mathrm{H}, \mathrm{Ph}), 13.2(\mathrm{br} \mathrm{s}, 1 \mathrm{H}, \mathrm{COOH}) . \delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}, 75.5 \mathrm{MHz}\right)-3.5\left(\mathrm{q}, \mathrm{SiMe}_{3}\right), 23.5(\mathrm{q}$, $\mathrm{CH}_{3}$ ), 29.4 (t, C-5), 33.6 ( $\mathrm{s}, \mathrm{C}-7 \mathrm{a}$ ), 41.3 (d, C-4), 43.4 (d, C-3a), 46.6 (t, $\mathrm{PhCH}_{2}$ ), 54.3 (t, C-1), 122.9 (d, C-7), 127.5, 127.7, 128.6 (3 d, Ph), 134.3, 134.9 (2 s, Ph and C-6), 175.42, 176.2 (2 s, COOH and CO). Signal assignments are based on ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}-\mathrm{COSY}$ and NOESY experiments. Anal. 2-Benzyl-3-oxo-2,3,3a,4,4a,5,6,7,8,9a-octahydro-1H-benz[f]isoindol-4-carboxamide (12). A solution of $\mathbf{6 c}(1.11 \mathrm{~g}, 4.88 \mathrm{mmol})$ and maleic imide ( $0.437 \mathrm{~g}, 4.50 \mathrm{mmol}$ ) in toluene ( 10 mL ) was heated in a sealed tube ${ }^{16}$ to $120^{\circ} \mathrm{C}$ for 2 h . Removal of the solvent in vacuo yielded 1.24 g of a red viscous liquid. The crude product crystallized from a mixture of ethyl acetate, diethyl ether, and tetrahydrofuran ( $1 / 1 / 1, \mathrm{v} / \mathrm{v} / \mathrm{v}$ ) to give 12 ( $759 \mathrm{mg}, 48 \%$ ) as colorless crystals; mp 199$203^{\circ} \mathrm{C}$.
NMR data: $\delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}, 600 \mathrm{MHz}\right) 1.24-1.27(\mathrm{~m}, 1 \mathrm{H}), 1.40-1.44(\mathrm{~m}, 2 \mathrm{H}), 1.81-1.87(\mathrm{~m}, 2 \mathrm{H})$, 1.94-2.02 (m, 2 H), 2.19-2.21 (m, 1 H), 2.52 (br s, $1 \mathrm{H}, 4 \mathrm{a}-\mathrm{H}$ ), 2.92 (br s, $1 \mathrm{H}, 9 \mathrm{a}-\mathrm{H}$ ), 2.97 (d, $J$ $=9.7,1 \mathrm{H}, 1 / 2 \times 1-\mathrm{H}_{2}$ ), 3.00 (br s, $1 \mathrm{H}, 4-\mathrm{H}$ ), 3.13 (dd, $J=6.3, J=3.5,1 \mathrm{H}, 3 \mathrm{a}-\mathrm{H}$ ), 3.46 (dd, $J=$ $\left.\left.9.5, J=6.7,1 \mathrm{H}, 1 / 2 \times 1-\mathrm{H}_{2}\right), 4.10,4.79\left(2 \mathrm{~d} \text {, each }{ }^{2} J=15.1,2 \times 1 \mathrm{H}, \mathrm{PhCH}\right)_{2}\right), 5.01(\mathrm{~s}, 1 \mathrm{H}, 9-\mathrm{H})$, 5.68 (br s, $1 \mathrm{H}, 1 / 2 \times \mathrm{CONH}_{2}$ ), $7.20-7.34$ (m, $5 \mathrm{H}, \mathrm{Ph}$ ), 9.78 (br s, $1 \mathrm{H}, 1 / 2 \times \mathrm{CONH}_{2}$ ). $\delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}\right.$, 75.5 MHz ) 26.8, 28.8, 31.0 (3 t), 34.2 (d, C-9a), 36.4 (t, C-8), 39.5 (d, C-4a), 41.0 (d, C-3a), 46.6 (t, PhCH2) 46.9 (d, C-4), 51.7 (t, C-1), 118.0 (d, C-9), 127.68, 127.74, 128.7 (3 d, Ph), 135.7, 145.3 ( $2 \mathrm{~s}, \mathrm{Ph}$ and $\mathrm{C}-8 \mathrm{a}$ ), 175.6, 176.4 ( $2 \mathrm{~s}, \mathrm{CONH}_{2}$ and CO ). Signal assignments are based on ${ }^{1} \mathrm{H},{ }^{1} \mathrm{H}$-COSY90 and HETCOR experiments. Anal. Calcd. for $\mathrm{C}_{20} \mathrm{H}_{24} \mathrm{~N}_{2} \mathrm{O}_{2}$ (324.43): C, 74.05; H, 7.46; N, 8.63. Found: C, 73.61; H, 7.47; N, 8.58.

X-Ray crystallography. Data for the crystal structure determinations were collected on a Nonius CAD4-MACH3 diffractometer. The Shelxs-86 software was used to determine the structures, and the refinement was performed using the Shelxl-93 software. The results of the crystal structure determinations and the crystallographic data of $\mathbf{8}, \mathbf{9}$, and $\mathbf{1 2}$ are summarized in Table $1 .{ }^{17}$

Table 1. Crystallographic data and parameters of the crystal structure determinations
