#### Abstract

Benzyl (3S,4E)-4-[(dimethylamino)methylidene]-5-oxotetrahydrofuran-3-ylcarbamate 5 was prepared in 4 steps from L-aspartic acid $\mathbf{1}$. Acid-catalysed treatment of $\mathbf{5}$ with amines $\mathbf{6}$ gave the dimethylamine substitution products 7. Benzyl (3S,4E)-4-[(arylamino)methylidene]-5-oxotetrahydrofuran-3-ylcarbamates $7 \mathbf{c}-\mathbf{n}$ were prepared by parallel solution phase synthesis from 5 and anilines $\mathbf{6 c - n}$ in $45-94 \%$ yields. Enaminone 5 reacted with potassium cyanide in the presence of 18-crown-6 to afford benzyl 4-cyanomethyl-5-oxo-2,5-dihydrofuran-3-ylcarbamate 9. Upon reaction of $\mathbf{9}$ with nitrile oxide $\mathbf{1 0}$ the $1,2,4$-oxadiazole derivative $\mathbf{1 1}$ was isolated in poor yield, while treatment of 9 with diazomethane 12 furnished the methylation products 13 and 14.

## Introduction

Recently, 5-substituted (S)-1-acyl-3-[(dimethylamino)methylidene]pyrrolidin-2-ones and (S)-3-[(dimethylamino)methylidene]tetrahydrofuran-2-ones, chiral cyclic analogues of alkyl 2substituted 3-(dimethylamino)propenoates, ${ }^{1}$ were introduced as reagents for the preparation of various functionalised heterocyclic compounds. ${ }^{2}$ For example, they were employed in the 'ring switching' preparation of 3-heteroarylalanine-, ${ }^{3} 3$-heteroarylalaninol-, ${ }^{4}$ 3-heteroaryllactic acid-, ${ }^{5}$ and 3-heteroarylpropan-1,2-diol derivatives, ${ }^{6}$ in stereoselective $\alpha$-amination of $\gamma$-lactams and $\gamma$ lactones ${ }^{7}$, and in stereoselective 1,3-dipolar cycloadditions to 3-cyanomethylidene substituted pyrrolidin-2-ones ${ }^{8}$ and tetrahydrofuran-2-ones ${ }^{9}$. Just recently, ( $1 R, 4 R$ )-3-[(E)-(dimethylamino)
methylidene]-1,7,7-trimethylbicyclo[2.2.1]heptan-2-one, $\quad(1 R)-(+)$-camphor derived $N, N-$ dimethylenaminone, was used for stereoselecive synthesis of $(1 R, 3 R, 4 R)$-3-(1,2,4-triazolo[4,3$x]$ azin-3-yl)-1,7,7-trimethylbicyclo[2.2.1]heptan-2-ones. ${ }^{10}$

In continuation of our research in the field of chiral 3-(dimethylamino)propenoate analogues, we report the preparation and transformations of benzyl (3S,4E)-4-[(dimethylamino)methylidene]-5-oxotetrahydrofuran-3-ylcarbamate 5, a novel representative in this series, and its utilisation in the solution phase parallel synthesis of benzyl ( $3 S, 4 E$ )-4-[(arylamino)methylidene]-5-oxotetrahydrofuran-3-ylcarbamates 7c-n.

## Results and Discussion

The starting compound, benzyl ( $S$ )-5-oxotetrahydrofuran-3-ylcarbamate 4 was prepared in 3 steps from L-aspartic acid $\mathbf{1}$ according to the procedures described in the literature. ${ }^{11-13}$ Lactone 4 was then treated with bis(dimethylamino)-tert-butoxymethane (Bredereck's reagent) to give benzyl ( $3 S, 4 E$ )-4-[(dimethylamino)methylidene]-5-oxotetrahydrofuran-3-ylcarbamate 5 in $89 \%$ yield (Scheme 1).

Scheme 1. Reagents and conditions: i) $\mathrm{ClCOOBn}, \mathrm{NaOH}, \mathrm{H}_{2} \mathrm{O}, 0{ }^{\circ} \mathrm{C}$; ii) $\mathrm{Ac}_{2} \mathrm{O}, 100{ }^{\circ} \mathrm{C}$; iii) $\mathrm{NaBH}_{4}$, THF, $0-20{ }^{\circ} \mathrm{C}$, then benzene, $p$-TsOH (cat.), reflux (Dean-Stark apparatus); iv) $t$ $\mathrm{BuOCH}\left(\mathrm{NMe}_{2}\right)_{2}$, toluene, $100{ }^{\circ} \mathrm{C}$.

First investigations on reactivity of the enamino lactone 5 towards nucleophiles revealed that, in contrast to previously established general reactivity pattern of various 3(dimethylamino)propenoates, ${ }^{1,2}$ compound 5 is quite unstable under acidic conditions. In most cases, acid-catalysed reactions with various nucleophiles, such as aliphatic and heteroaromatic amines, $N, N-, C, N-$, and $C, O$-ambident nucleophiles, and potassium cyanide, gave inseparable mixtures of products. Only upon reaction of $\mathbf{5}$ with 3 -aminoisoxazole $\mathbf{6 a}$ and piperidine $\mathbf{6 b}$, the dimethylamine substitution products $7 \mathbf{a}$ and $\mathbf{7 b}$ were isolated in poor yields. On the other hand,
preliminary tests showed that dimethylamine substitution in reactions of $\mathbf{5}$ with anilines $\mathbf{6}$ in 50\% aqueous ethanol proceed smoothly and in good yields. Therefore, we carried out the parallel solution-phase synthesis of benzyl $(3 S, 4 E)-4-[($ arylamino $) m e t h y l i d e n e]-5-o x o t e t r a h y d r o f u r a n-3-$ ylcarbamates $7 \mathbf{c}-\mathbf{n}$, which were prepared in $45-94 \%$ yields. In most cases, analytically pure compounds were obtained upon filtration, washing, and thorough drying. Compounds 7a,b,n were isolated in isomerically pure form, while compounds $7 \mathbf{c}-\mathbf{m}$ were obtained as mixtures of the major $(E)$-isomers and the minor ( $Z$ )-isomers (Scheme 2).

Scheme 2. Method A: classical (single vessel) synthesis ( $\mathbf{6 a , b} \rightarrow \mathbf{7 a , b}$ ); Method B: parallel synthesis ( $\mathbf{6 c}-\mathbf{n} \rightarrow \mathbf{7 c}-\mathbf{n}$ ).

Attempts to prepare the 4 -cyanomethylidene analogue $\mathbf{8}$ by acid-catalysed dimethylamine substitution under various reaction conditions failed. However, when reaction of 5 with potassium cyanide was carried out in dichloromethane in the presence of 1 equivalent of 18 -crown-6, benzyl 4-cyanomethyl-5-oxo-2,5-dihydrofuran-3-ylcarbamate 9 was obtained in $60 \%$ yield. Most probably, this transformation proceeds via the cyanomethylidene compound $\mathbf{8}$ as the intermediate, which then isomerises into the cyanomethyl tautomer 9. Similar base-catalysed
migration of the exocyclic $\mathrm{C}=\mathrm{C}$ double bond has been observed previously in 3-cyanomethylidene-5-methoxycarbonyl-2-pyrrolidinone series. ${ }^{8}$ 1,3-Dipolar cycloaddition of 2,6dichlorobenzonitrile oxide $\mathbf{1 0}$ to dipolarophile $\mathbf{9}$ in chloroform under reflux afforded cycloadduct $\mathbf{1 1}$ in $7 \%$ yield. Since IR spectrum of $\mathbf{1 1}$ does not exhibit a signal characteristic for the cyano group, we presume, that cycloaddition of $\mathbf{1 0}$ to nitrile 9 is taking place to the $\mathrm{C} \equiv \mathrm{N}$ triple bond and not to the $\mathrm{C}=\mathrm{C}$ double bond, thus furnishing the $1,2,4$-oxadiazole derivative $\mathbf{1 1}$. On the other hand, treatment of 9 with diazomethane 12 gave the $N$-methylated compound $\mathbf{1 3}$ and the $O$ methylated compound 14 in $41 \%$ and $7 \%$ yield, respectively (Scheme 3).

## Structure determination

Structures of novel compounds 5, 7a-n, 9, 11, 13, and $\mathbf{1 4}$ were determined by spectroscopic methods (IR, NMR, MS) and by elemental analyses for C, H, and N. Compounds 7a,b,d,j,n, 11, and 14 were not prepared in analytically pure form; their identity was confirmed by HRMS.

The $(E)$-configuration around the exocyclic $\mathrm{C}=\mathrm{C}$ double bond in compound 5 was determined by NMR on the basis of NOE between $H-\mathrm{C}(3)$ and $\mathrm{NMe} e_{2}$ group. Similarly, the $(E)$ configuration was established for compound $\mathbf{7 1}$ on the basis of NOE between $H-\mathrm{C}(3)$ and $H-\mathrm{N}-$ $\mathrm{C}\left(4^{\prime}\right)$. In the case of enaminone 5 , the $(E)$-configuration was additionally confirmed by 2 D HMBC techique on the basis of magnitude of the heteronuclear long range coupling constant, ${ }^{3} J_{\mathrm{C}-\mathrm{H}}$. Generally, the magnitude of coupling constans ${ }^{3} J_{\mathrm{C}-\mathrm{H}}$ for nuclei with cis-orientation around
the $\mathrm{C}=\mathrm{C}$ double bond are smaller $(2-6 \mathrm{~Hz})$ than those for the trans-oriented nuclei $(8-12 \mathrm{~Hz}) .{ }^{14}$ In compound 5, the magnitude of coupling constant, ${ }^{3} J_{\mathrm{C}-\mathrm{H}}=5 \mathrm{~Hz}$, showed the cis-configuration between $H$ - $\mathrm{C}\left(4^{\prime}\right)$ and $C(5)$, and was in agreement with the magnitudes determined previously for analogous compounds (Scheme 4). ${ }^{8-10,14,15}$

## Conclusions

Benzyl (3S,4E)-4-[(dimethylamino)methylidene]-5-oxotetrahydrofuran-3-ylcarbamate 5, a novel chiral 3-dimethylaminopropenoate analogue, is available in 4 steps from L-aspartic acid. Parallel treatment of 5 with 12 aromatic amines under mild conditions afforded the corresponding dimethylamine substitution products in good yields. However, with respect to previously prepared 3-(dimethylamino)propenoates and their analogues, enamino lactone 5 turned out to be quite unstable under acidic conditions, which are usually employed for reactions of related $N, N-$ dimethylenaminones with nucleophiles. On the other hand, substitution of the dimethylamino group in compound 5 by the cyano group was achieved under basic conditions. However, this substitution was accompanied by migration of the exocyclic $\mathrm{C}=\mathrm{C}$ double bond into the ring and by loss of chirality.

## Experimental Section

General Procedures. Parallel synthesis of compounds $\mathbf{7 c}-\mathbf{n}$ was carried out on a Mettler-Toledo Bohdan MiniBlock ${ }^{\text {TM }}$ Compact Shaking and Washing Station and Vacuum Collection Base (12 positions). Melting points were taken with a Kofler micro hot stage. The ${ }^{1}$ H NMR spectra ( 300 $\mathrm{MHz})$ and ${ }^{13} \mathrm{C}$ NMR ( 75.5 MHz ) spectra were obtained with a Bruker Avance DPX 300 (300 $\mathrm{MHz})$ spectrometer with DMSO- $d_{6}$ and $\mathrm{CDCl}_{3}$ as solvents and $\mathrm{Me}_{4} \mathrm{Si}$ as internal standard. IR spectra were recorded with a Perkin-Elmer 1310 and Perkin-Elmer Spectrum BX FTIR
spectrophotometers ( KBr discs). The microanalyses for $\mathrm{C}, \mathrm{H}$, and N were obtained with a Perkin-Elmer CHN Analyser 2400. Optical rotations were measured by a Perkin-Elmer-241-MC polarimeter. The MS spectra were recorded with an Autospeck Q (VG-Analytical) spectrometer in Laboratory for Mass Spectroscopy (J. Stefan Institute, Ljubljana). TLC: Merck, Alufolien Kieselgel 60 F 254, 0.2 mm . Column chromatography was performed on a silica gel (Fluka, Kieselgel 60, 0.04-0.063 mm).

All starting materials were commercially available (in most cases from Fluka) and purified following the standard techniques. Benzyl (S)-5-oxotetrahydrofuran-3-ylcarbamate 4, ${ }^{13}$ 2,6dichlorobenzonitrile oxide $\mathbf{1 0},{ }^{16}$ and diazomethane $\mathbf{1 2}^{17}$ were prepared according to the procedures described in the literature.

Benzyl (3S,4E)-4-[(dimethylamino)methylidene]-5-oxotetrahydrofuran-3-ylcarbamate (5). MiniBlock ${ }^{\mathrm{TM}}$ parallel synthesiser with 12 positions was equipped with glass reaction vessels ( 20 mL each) with fritted bottom. The frits were wetted with ethanol ( $\sim$ 0.5 mL each), the MiniBlock ${ }^{\mathrm{TM}}$ was closed, and mounted onto the shaking and washing station. The reaction vessels were loaded via syringe with aqueous solutions of anilines hydrochlorides $\mathbf{6 c}-\mathbf{n}(0.25 \mathrm{M}$ in water, $2 \mathrm{~mL}=0.5 \mathrm{mmol}$ to each position). Then a warm ethanolic solution of compound $5\left(\sim 40-50^{\circ} \mathrm{C}, 0.25 \mathrm{M}\right.$ in ethanol, $\left.2 \mathrm{~mL}=0.5 \mathrm{mmol}\right)$ was added via syringe to each reaction vessel. The reaction mixtures were stirred ( 350 r.p.m., Vortex stirring) at room temperature for 12 h . During this time, precipitation of the products occurred. The MiniBlock ${ }^{\mathrm{TM}}$ was removed from the shaking and washing station, put onto the vacuum collection base, and opened. The reaction mixtures were filtered and the precipitates were washed with water ( $2 \times 5$ mL ). The reaction vessels with products were taken out from the MiniBlock ${ }^{\mathrm{TM}}$ and put into a dessiccator. Benzyl 4-cyanomethyl-5-ox0-2,5-dihydrofuran-3-ylcarbamate (9). Potassium cyanide ( $0.390 \mathrm{~g}, 6 \mathrm{mmol}$ ) and 18 -crown-6 ( $1.58 \mathrm{~g}, 6 \mathrm{mmol}$ ) were added to a solution of $5(1.45 \mathrm{~g}, 5$ mmol ) in dichloromethane ( 50 mL ) and the mixture was heated under reflux for 6 h . Volatile components were evaporated in vacuo and the residue was purified by column chromatography (ethyl acetate). Fractions containing the product were combined, evaporated in vacuo, and the solid residue was crystallised from ethyl acetate to give 9. Yield: $0.816 \mathrm{~g}(60 \%)$, white crystals, $\mathrm{mp} 198-200{ }^{\circ} \mathrm{C}$ (from ethyl acetate).
