#### Abstract

Total synthesis of naturally occurring microcarpalide and herbarumin III are described. The ringclosing metathesis (RCM) approach to coin the medium sized rings present in their molecular structures form the basic premise of this investigation.

Keywords: Microcarpalide, herbarumin III, ring-closing metathesis (RCM), microfilament, phosphodiesterase

## Introduction

Medium ring compounds having a ring size between 8 to $11^{1}$ are increasingly being isolated from natural resources. By the virtue of their biological significance, the synthesis of these natural products has attracted attention of many groups. This article describes the RCM based approaches to the total synthesis of two medium ring sized natural products microcarpalide (1) and herbarumin III (4). Bio-assay guided purification of fermentation broth of Ficus microcarpa L led to the isolation of microcarpalide ${ }^{2 a}(\mathbf{1})$, structurally related to a family of phytotoxins ${ }^{3}$ but differs in the hydroxylation pattern, the double bond position within the 10 -membered lactone and the length of the side chain at $\mathrm{C}-10$. Microcarpalide ${ }^{4}$ possesses microfilament disrupting activity. On similar lines, fermentation broth and mycelium of the fungus Phoma herbarum produced three new phytotoxic nonenolides named as herbarumin (I-III) (2-4). Herbarumin I-III interacts with bovine-brain calmodulin and inhibits the activation of the calmodulin-dependent enzyme camp phosphodiesterase.

Figure 1. Structures of microcarpalide and herbarumins.

With $\mathrm{RCM}^{5}$ reaction destined to provide the oxecin ring framework, it was apparent that micrcarpalide (1) was disassembled into fragments 5 and 6 having terminal olefins group whilst the hydroxyl and acid groups at the other ends of 5 and 6 ensured their union through esterification. ${ }^{6}$ Both the fragments $(\mathbf{5} \& 6)$ containing two chiral centers were realized by facile zinc mediated elimination ${ }^{7}$ and Sharpless asymmetric dihydroxylation ${ }^{8}$ as delineated in Scheme 1.

D-Mannose

## Scheme 1

On a similar premise, the synthetic strategy for herbarumin III (4) $)^{9,10}$ relied on the union of two fragments $\mathbf{1 1}$ and 12. The synthesis of $\mathbf{1 1}$ was planned from D-glucose whose steregenic centers at C-2 and C-4 were correlated with C-8 and C-10 of herbarumin III (4).

## Results and Discussions

## Total synthesis of microcarpalide (1)

D-mannose was converted into the conjugated ester derivative (13) by a reported sequence. ${ }^{11,12}$ Subsequent treatment of $\mathbf{1 3}$ with DIBAL- H in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at $-78{ }^{\circ} \mathrm{C}$ for 1 h afforded the allyl alcohol whose primary hydroxyl was protected as the MEM-ether (14). ${ }^{13}$ The structural identity was secured by the interpretation of the ${ }^{1} \mathrm{H}$ NMR spectrum. For example, two singlets resonated at $\delta$ 4.67 and $\delta 3.4$ were attributed to methylene and methoxyl groups of MEM. 14 was hydrogenolysed in the presence of $\mathrm{Pd} / \mathrm{C}$ and consequently exposed to LAH in THF to produce the diol derivative (16).

Reagents and conditions: (a) (i) DIBAL-H, $\mathrm{CH}_{2} \mathrm{Cl}_{2},-78{ }^{\circ} \mathrm{C}$ to $0{ }^{\circ} \mathrm{C}, 2 \mathrm{~h}, 92 \%$; (ii) MEM-Cl, ${ }^{i} \mathrm{Pr}_{2} \mathrm{NEt}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, \mathrm{rt}, 10 \mathrm{~h}, 78 \%$; (b) $\mathrm{H}_{2}, 10 \% \mathrm{Pd}-\mathrm{C}, \mathrm{MeOH}, 6$ bar, $60^{\circ} \mathrm{C}, 4 \mathrm{~h}, 96 \%$; (c) $\mathrm{LiAlH}_{4}$, THF, rt, $1 \mathrm{~h}, 92 \%$; (d) (i) $\left(\mathrm{CH}_{3}\right)_{3} \mathrm{CCOCl}$, pyridine, $0^{\circ} \mathrm{C}-\mathrm{rt}, 1 \mathrm{~h}, 91 \%$; (ii) TBSCl, DMF, imidazole, rt, $4 \mathrm{~h}, 90 \%$; (iii) DIBAL-H, $\mathrm{CH}_{2} \mathrm{Cl}_{2},-78^{\circ} \mathrm{C}, 1 \mathrm{~h}, 89 \%$.

In order to introduce iodide at $\mathrm{C}-1$, the protection-deprotection ${ }^{14-16}$ sequence on $\mathbf{1 6}$ was performed to obtain the primary hydroxyl derivative (17). Treatment of $\mathbf{1 7}$ with $\mathrm{I}_{2}$, TPP and imidazole in toluene at room temperature led to the formation of 7 in $40 \%$ yield. Addition of $\mathrm{Et}_{3} \mathrm{~N}$ marginally improved the yield of $7(45 \%)$, however, the formation of the cyclized product 18 (15\%) was also noticed (Scheme 4). ${ }^{17 \mathrm{a}}$ The iodination reaction carried out in the presence of $\mathrm{I}_{2}$, TPP and imidazole but in benzene-ether ( $2: 1$ ) medium ${ }^{17 \mathrm{~b}}$ provided 7 in $86 \%$ yield. In the ${ }^{1} \mathrm{H}$ NMR spectrum of 7, the resonances due to $\mathrm{CH}_{2}$ I were located at 3.12 as a triplet ( $J=10.4 \mathrm{~Hz}$ ), and at 3.27 as a doublet of doublet $(J=10.4,3.3 \mathrm{~Hz}$ ) (Scheme 5).

Conversion of 7 into 19 was accomplished by Zinc mediated elimination ${ }^{7}$ reaction in refluxing ethanol. In the ${ }^{1} \mathrm{H}$ NMR spectrum of 19 , typical pattern for terminal olefinic protons were observed. The dibenzyl derivative 20 was produced by desilylation ${ }^{12}$ followed by benzylation and deprotection of MEM group. ${ }^{18}$ Compound 21 was transformed into the acid derivative in two steps which first involved Swern oxidation and reaction with aqueous $\mathrm{NaClO}_{2}$ in DMSO and phosphate buffer. ${ }^{19}{ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ spectra of 5 were compatible with the assigned structure (Scheme 5).

The journey toward the synthesis of 6 began with commercially available 1-heptanal (22), which upon two-carbon Wittig homologation with $\mathrm{Ph}_{3} \mathrm{P}=\mathrm{CHCO}_{2} \mathrm{Et}$ in benzene at $80^{\circ} \mathrm{C}$ gave 9 as a mixture of trans and cis isomers in the ratio of $85: 15 .{ }^{20}$ They were separated by silica gel chromatography and the major trans isomer was subjected to Sharpless asymmetric dihydroxylation procedure ${ }^{8}$ in the presence of $(\mathrm{DHQ})_{2} \mathrm{PHAL}, \mathrm{K}_{2} \mathrm{Fe}(\mathrm{CN})_{6}, \mathrm{~K}_{2} \mathrm{CO}_{3}, \mathrm{MeSONH}_{2}$ and $\mathrm{K}_{2} \mathrm{OsO}_{4} ; 2 \mathrm{H}_{2} \mathrm{O}$ in $t$ - $\mathrm{BuOH}-\mathrm{H}_{2} \mathrm{O}(1: 1)$ at $0{ }^{\circ} \mathrm{C}$ for 10 h to afford the diol 23. The compound was thoroughly investigated by the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra and elemental analysis (Scheme 6). Enatiomeric purity of $\mathbf{2 3}$ was estimated to be $97.5 \%$ ee, by chiral HPLC analysis of the corresponding dibenzoate using a chiracel OD column ( $1 \%$ i-propanol/n-hexane, flow rate 2.0 $\mathrm{mL} / \mathrm{min}, \lambda=225 \mathrm{~nm}$ ). The diol 23 was treated with 2,2-dimethoxypropane-cat. $p$-TSA, reduction with DIBAL-H in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at $-78{ }^{\circ} \mathrm{C}$ followed by tosylation gave $24 .{ }^{21}$ Acid hydrolysis, ${ }^{22}$ cyclisation with $\mathrm{K}_{2} \mathrm{CO}_{3}$ in MeOH followed by protection of hydroxyl group as the MEM group to afford 8. The ${ }^{1} \mathrm{H}$ NMR, ${ }^{13} \mathrm{C}$ NMR spectra and elemental analysis were in accordance with the structure of $\mathbf{8}$. The ring opening reaction of the oxirane $\mathbf{8}$ with vinyl magnesium bromide in THF at $0{ }^{\circ} \mathrm{C}$ led to a mixture of products in which the require product 6 was formed as a minor product. This was partly attributed to side reactions particularly iodide mediated ring opening reaction (Scheme 6). However, the two step sequence involving opening of epoxide ring with lithium acetylide-EDA complex ${ }^{23}$ in DMSO followed by partial reduction of the triple bond in
the presence of Lindlar's catalyst ${ }^{24}$ afforded compound 6 (Scheme 7). The ${ }^{1} \mathrm{H}$ NMR spectrum of 6 showed resonances for terminal olefinic protons at $\delta 5.06-5.17$ (multiplet), and at $\delta 5.88$ (dt, $J$ $=17.6,10.6,7.0 \mathrm{~Hz}$ ). The ${ }^{13} \mathrm{C}$ NMR spectrum indicated peaks at $117.1,134.9$ for olefinic carbons.

The coupling reaction of fragments 5 and $\mathbf{6}$ was performed in the presence of $\mathrm{DCC}^{6}$ and DMAP in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The structure of the derived ester 26 was confirmed by the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra (Scheme 8 ). In the ${ }^{1} \mathrm{H}$ NMR spectrum, a clear-cut down field shift of $\mathrm{H}-10$ signal was observed, which indicated that the ester formation had indeed occurred.

(c) $\mathrm{TiCl}_{4}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, 0{ }^{\circ} \mathrm{C}, 0.5 \mathrm{~h}, 76 \%$.

Ring closing metathesis reaction ${ }^{5}$ of 26 with Grubbs' catalyst $\left(\mathrm{Cl}_{2} \mathrm{PCy}_{3} \mathrm{Ru}=\mathrm{CHPh}\right)$ in degassed $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ afforded the ten-membered lactone derivative as a mixture of two geometrical isomers in 10:1 ratio whose silica gel purification gave the pure $E$-isomer (27). The ${ }^{1} \mathrm{H}$ NMR spectrum of 27 showed two olefinic protons at $\delta 5.64$ and $5.73(J=15.8)$ (Scheme 8). For the deprtection of MEM-group, 27 was exposed to titanium tetrachloride ${ }^{10,21}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at $0{ }^{\circ} \mathrm{C}$. However, this treatment resulted in the simultaneous removal of MEM as well benzyl ethers and led to the formation of microcarpalide (1) whose NMR spectrum in $\mathrm{CD}_{3} \mathrm{CN}$ revealed two slowly inter-converting conformers in a ration of 76:24. The resonances due to $\mathrm{H}-10$ were seen at 4.81 ppm for the major conformer and at 4.63 ppm for the minor. This conformer ratio is identical to the $3.5: 1$ value reported for natural product in the in the same solvent.

## Total synthesis of herbarumin III (4)

The synthesis of herbarumin III began with the preparation of fragment 11 from D-glucose. The 3-deoxy-derivative ${ }^{25 a-b}$ of diacetonide-D-glucose selectively deprotected and then cleaved ${ }^{26}$ to give the aldehyde 30 which was treated with $\mathrm{EtPPh}_{3} \mathrm{Br}$ and $n-\mathrm{BuLi}$ at $-78{ }^{\circ} \mathrm{C}$ and then hydrogenated by using $10 \% \mathrm{Pd} / \mathrm{C}$ to afford the $n$-propyl sugar derivative 31 (Scheme 9).

(ii) $\mathrm{H}_{2}, \mathrm{Pd} / \mathrm{C}, 1 \mathrm{bar}, \mathrm{rt}, 3 \mathrm{~h}, 92 \%$. (c) $20 \% \mathrm{AcOH}$ in $\mathrm{H}_{2} \mathrm{O}$, conc. $\mathrm{H}_{2} \mathrm{SO}_{4}$ (catalytic), reflux, $6 \mathrm{~h}, 93 \%$. (ii) $\mathrm{PMBCl}, \mathrm{NaH}, \mathrm{DMF}, 0$ ${ }^{\circ} \mathrm{C}, 1 \mathrm{~h}, 94 \%$.

The 1,2-O-isopropylidene group of $\mathbf{3 1}$ was cleaved with $20 \%$ acetic acid and catalytic $\mathrm{H}_{2} \mathrm{SO}_{4}$ to afford the lactol derivative (32). Subsequent Wittig reaction ${ }^{27}$ with $\mathrm{Ph}_{3} \mathrm{P}=\mathrm{CH}_{2}$ to obtain the olefin which was converted in its PMB-ether derivative (11). The structure of (11) was confirmed by its ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR and mass spectral analysis.

The esterification reaction between 11 and 5 -hexenoic $\operatorname{acid}^{28}$ (12) was performed under Yamaguchi condition ${ }^{29}$ and deprotection of PMB group gave $\mathbf{1 0}$ which was a precursor for RCM reaction (Scheme 10).

Scheme 10. Reagents and conditions: (a) (i) 2,4,6-trichlorobenzoyl chloride, DMAP, THF, 11 in THF, $0{ }^{\circ} \mathrm{C}-\mathrm{rt}$, 4 h , $82 \%$; (ii) $\mathrm{DDQ}, \mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{H}_{2} \mathrm{O}$ (18:1), rt, $30 \mathrm{~min}, 94 \%$. (b) (i) $\mathrm{RuCl}_{2}$ (=CHPh)$\left(\mathrm{PCy}_{3}\right)_{2}, \mathrm{CH}_{2} \mathrm{Cl}_{2}$, reflux, 4 days, $36 \%$ ( $52 \%$ starting material recovered), (ii) $\mathrm{RuCl}_{2}(=\mathrm{CHPh})$ ( $\mathrm{PCy}_{3}$ )(IEMS), $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, reflux, $16 \mathrm{~h}, 78 \%$.

The RCM of $\mathbf{1 0}$ in the presence of Grubbs' 2 nd generation catalyst was efficient and high yielding, thus giving rise to dimmer as a minor product. The structure of $\mathbf{4}$ was confirmed by comparision of spectroscopic and optical rotation with reported values. ${ }^{9}$

## Conclusions

In summary, RCM reaction has been judiciously used to complete the total synthesis of medium ring size natural products microcarpalide 1 and herbarumin III (4).

## Experimental Section

General Procedures. Solvents were purified and dried by standard procedures before use. Column chromatography was carried out with silica gel (60-120 mesh). Infrared spectra were recorded with Shimadzu IR 420 and Perkin-Elmer 683 spectrometers. NMR spectra were recorded on Bruker AC-200 and Bruker DRX-500 machine in $\mathrm{CDCl}_{3}$ with TMS as internal standard. Mass spectra were obtained with Finningen MAT 1210 mass spectrometer. Optical rotations were measured with digital polarimeter. Elemental analysis was done on elemental analyzer model 1108 EA. All reactions were monitored on 0.25 mm E-Merck pre-coated silica gel (TLC) plates (60F-254) with UV or $\mathrm{I}_{2}$, anisaldehyde reagent in ethanol. Petroleum ether refers to mixture of hexanes with bp $60-80^{\circ} \mathrm{C}$.

To a stirred solution of above diol $(7.10 \mathrm{~g}, 34.88 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(150 \mathrm{~mL})$, was added sodium meta periodate ( 72.0 g ) adsorbed over silica gel (200-400 mesh) at $0{ }^{\circ} \mathrm{C}$, and left at ambient temperature for 30 min . After complete consumption of starting material (checked by TLC), the reaction mixture was filtered through sintered funnel, residue thoroughly washed with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \times 50 \mathrm{~mL})$. The combined organic layers were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated to afford the crude aldehyde 30 ( $5.68 \mathrm{~g}, 95 \%$ ) as viscous liquid which was used as such for the next reaction.
3-Deoxy-5,6-dideoxy-1,2-O-isopropylidene- $\alpha$-D-ribohept furanoside (31). n-Butyl lithium ( $49 \mathrm{~mL}, 1.6 \mathrm{M}$ in hexane) was slowly added to a stirred solution of ethylene triphenylphosphonium bromide ( $29.0 \mathrm{~g}, 78.2 \mathrm{mmol}$ ) in anhydrous THF ( 200 mL ) at $-78{ }^{\circ} \mathrm{C}$ under nitrogen atmosphere. The stirring was continued at the same temperature for 1 h . To the red wine colored solution, was added crude aldehyde $30(5.38 \mathrm{~g}, 31.27 \mathrm{mmol})$ in THF ( 50 mL ) drop wise at $-78{ }^{\circ} \mathrm{C}$. The stirring was continued for additional 3 h at $0^{\circ} \mathrm{C}$. After complete consumption of starting material (checked by TLC), the reaction was quenched by slow addition of saturated ammonium chloride solution, extracted with ethyl acetate ( $2 \times 100 \mathrm{~mL}$ ). The combined organic fractions were washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, concentrated. The residue was purified by silica gel chromatography using ethyl acetate: light petroleum (1:9) to afford the Wittig product as a colorless liquid $(4.71 \mathrm{~g}, 82 \%)$. $[\alpha]_{\mathrm{D}}-23.4\left(c 1.45, \mathrm{CHCl}_{3}\right) ;{ }^{1} \mathrm{H}$ NMR ( 500 MHz ): $\delta 1.31(\mathrm{~s}, 3$ H), $1.53(\mathrm{~s}, 3 \mathrm{H}), 1.55(\mathrm{dd}, 1 \mathrm{H}, J=13.2,4.2 \mathrm{~Hz}), 1.70(\mathrm{~d}, 3 \mathrm{H}, J=6.9 \mathrm{~Hz}), 2.11(\mathrm{dd}, 1 \mathrm{H}, J=$ $13.2,4.2 \mathrm{~Hz}), 4.60(\mathrm{t}, 1 \mathrm{H}, J=4.3 \mathrm{~Hz}), 4.95(\mathrm{~m}, 1 \mathrm{H}), 5.36(\mathrm{t}, 1 \mathrm{H}, J=8.7 \mathrm{~Hz}), 5.63(\mathrm{~m}, 1 \mathrm{H})$, 5.69 (d, $1 \mathrm{H}, J=3.9 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}$ NMR ( 125 MHz ): $\delta 13.5,26.1,26.7,39.5,73.0,80.6,105.2,110.7$, 128.2, 129.0.; Anal. Oct-1-ene-(3R, 5R)-diol (32). Compound $31(4.30 \mathrm{~g}, 23.11 \mathrm{mmol})$ in $20 \%$ aqueous acetic acid $(40 \mathrm{~mL})$ and few drops of concentrated $\mathrm{H}_{2} \mathrm{SO}_{4}$ was refluxed for about 6 h . Then reaction mixture was brought to rt, neutralized by addition of solid sodium carbonate. It was partitioned between ethyl acetate and water, the organic layer was washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, concentrated to obtain the crude product which was passed through a short bed of silica gel using ethyl acetate: light petroleum (1:1) to afford the pure lactol 32 ( $3.14 \mathrm{~g}, 93 \%$ ). This unstable product was used immediately in next step without characterization.
(3R)-(4-Methoxybenzyloxy)-oct-1-ene-(5R)-ol (11). To the solution of methylene triphenyl phosphonium iodide ( $26.0 \mathrm{~g}, 64.5 \mathrm{mmol}$ ) in anhydrous THF ( 175 mL ), was added n-butyl lithium ( $40 \mathrm{~mL}, 1.6 \mathrm{M}$ in hexane) drop wise at $0{ }^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$ atmosphere. After 1 h , lactol 32 $(3.14 \mathrm{~g}, 21.50 \mathrm{mmol})$ in THF ( 30 mL ) was slowly added while maintaining the reaction temperature $0{ }^{\circ} \mathrm{C}$. The reaction mixture was brought to rt slowly and allowed to stir for additional 11 h . The reaction mixture was quenched with saturated ammonium chloride solution, extracted with ethyl acetate $(3 \times 100 \mathrm{~mL})$ and the combined organic layers were washed with brine, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, concentrated to get the crude product which was purified by silica gel column chromatography using ethyl acetate: light petroleum (1:3) to afford diol as a colorless liquid $(2.35 \mathrm{~g}, 76 \%) .[\alpha]_{\mathrm{D}}+32\left(c, 0.8, \mathrm{CHCl}_{3}\right) ;{ }^{1} \mathrm{H} \operatorname{NMR}(500 \mathrm{MHz}): \delta 0.91(\mathrm{t}, 3 \mathrm{H}, J=0.91 \mathrm{~Hz})$, 1.32-1.47 (m, 4 H), 1.52-1.59 (m, 2 H ), 3.85 (br s, 1 H ), 4.32 (br s, 1 H ), 5.05 (d, $1 \mathrm{H}, J=10.81$, $\mathrm{Hz}) 5.21\left(\mathrm{~d}, 1 \mathrm{H}, J=10.81 \mathrm{~Hz}\right.$ ), 5.83 (ddd, $1 \mathrm{H}, J=16.29,10.39,5.90 \mathrm{~Hz}$ ); ${ }^{13} \mathrm{C}$ NMR ( 125 MHz): $\delta 13.8,18.3,39.8,42.5,73.0,114.0,140.5$; Anal. ## Herbarumin III (4)

Ring closing metathesis of diene $\mathbf{1 0}$ with first generation Grubbs' catalyst. A mixture of $\mathbf{1 0}$ ( $100 \mathrm{mg}, 0.40 \mathrm{mmol}$ ) in anhydrous $\mathrm{CH}_{2} \mathrm{Cl}_{2}(100 \mathrm{~mL}$ ) and Grubbs' first generation catalyst ( 45 $\mathrm{mg}, 0.05 \mathrm{mmol}$ ) was degassed with argon for 15 min and refluxed for 4 days by the time TLC showed the consumption of only half of the starting diene. At this stage, the reaction was stopped and allowed to bring to room temperature. Solvent was removed under reduced pressure to leave highly dark brown colored residue. The crude product was purified by column chromatography using ethyl acetate: light petroleum (1:9) to afford herbarumin III (4) as colorless liquid ( 31 mg , 36 \%).
