#### Abstract

[3+3] Annulation protocol at an'off template site' on the sugar derived enal synthon effectively resulted in the formation of C-C linked pseudo saccharide precursors. Thus, the enolate of phosphorane generated from ethyl acetoacetate first undergoes a Michael reaction on the enal followed by a Wittig reaction to furnish the target saccharides, where the chirality is very effectively translated from the parent sugar.

## Introduction

Several antibiotics and compounds of biological interest incorporate glycosides of pseudosugars ${ }^{1-3}$ or carba-sugars ${ }^{4}$, since, they are endowed with relatively greater stability towards glycosidase-induced hydrolysis. Besides the application as enzyme inhibitors, the carba-sugars are discussed as synthetic intermediates for the preparation of more efficient drugs in order to substitute carbohydrate moieties ${ }^{5}$. Thus, development of novel and efficient methods for the enantioselective or enantiospecific construction of carbocycles ${ }^{6}$ resulted in a variety of useful routes such as Diels-Alder approaches, the double Michael cyclisation, 1,3-dipolar cycloaddition and free radical-induced C-C bond formation. As part of our ongoing efforts on the transformation of monosaccharides into new glycosubstances ${ }^{7-15}$, herein we describe the synthesis of C-C linked pseudo saccharide precursors 1-5 (Figure 1), adopting a Michael-Wittig reaction on sugar-derived enal.

## Results and Discussion

From the retro synthetic analysis of 1-5 (Scheme 1), it was envisaged that, the enones 6a-d are appropriate late stage intermediates, which could be realized from the condensation of $\alpha, \beta$ unsaturated aldehyde 7 and Wittig ylide 8 by a Michael-Wittig reaction. The enal 7 in turn could be made from D-glucose through aldehyde $\mathbf{9}$, while $\mathbf{8}$ could be prepared from ethyl acetoacetate.

Scheme 2. a) $\mathrm{Ph}_{3}=\mathrm{CHCO}_{2} \mathrm{Et}, \mathrm{C}_{6} \mathrm{H}_{6}$, reflux, b) DIBAL-H, $\mathrm{CH}_{2} \mathrm{CL}_{2},-23{ }^{\circ} \mathrm{C}$, c)PDC $\mathrm{CH}_{2} \mathrm{CL}_{2}$, reflux, d) $\mathrm{Ph}_{3} \mathrm{P}=\mathrm{CHCOCH}_{2} \mathrm{CO}_{2} \mathrm{Et}$, $\mathrm{NaH}, 2$ drops water, THF, $50^{\circ} \mathrm{C}$.

Aldehyde $\mathbf{9}^{16}$ was subjected to Wittig olefination (Scheme 2) with (ethoxycarbonyl methylene)triphenylphosphorane in benzene at reflux to give the ester 10, which on reduction with DIBAL-H in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ afforded $\mathbf{1 1}$ in $86 \%$ yield. Oxidation of $\mathbf{1 1}$ with PDC in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at reflux gave enal 7 (95\%), which on reaction with $\mathbf{8}^{17}$ in the presence of NaH and two drops of
water ${ }^{18}$ in THF at $50{ }^{0} \mathrm{C}$ for 10 min ., resulted in the formation of $\mathbf{6 a - d}$ as a partially separable mixture of diastereoisomers in (6:1.5:1.5:1) $75 \%$ overall yield. The stereochemical outcome of each of the annulated products was unambiguously determined by ${ }^{1} \mathrm{H}$ NMR spectra. The formation of 6a as major product, in the present study, indicates that the initial Michael-addition of nucleophile (sodium enolate of $\mathbf{8}$ ) on the $\gamma$-alkoxy enal system 7 results in the formation of a syn product ${ }^{19}$ and the aldehyde moiety of the adduct concomitantly undergoes a Wittig reaction in affording the cyclohexenone derivatives 6a-d.

The mixture of diastereoisomers $\mathbf{6 a}$ and $\mathbf{6 b}$ were separated from $\mathbf{6 c}$ and $\mathbf{6 d}$ by column chromatography and both the mixtures were independently treated with $\mathrm{NaBH}_{4}$ in ethanol (Scheme 3) in the presence of $\mathrm{CeCl}_{3} .7 \mathrm{H}_{2} \mathrm{O}$ under Luche's reaction conditions ${ }^{20}$. $\mathbf{6 a}$ and $\mathbf{6 b}$ afforded a mixture of alcohols $\mathbf{1 2}$ (major), $\mathbf{1 3}$ (minor) and $\mathbf{1 4}$ (single isomer) in the ratio of 4:1:2 respectively in a combined yield of $88 \%$, while $\mathbf{6 c}$ and $\mathbf{6 d}$ furnished $\mathbf{1 5}$ as an inseparable mixture of alcohols. Acetylation of alcohols 12-14 with acetic anhydride in pyridine independently gave the corresponding acetates 16, 17 and 18 respectively, while 15 gave 19, 20 and 21a-b. All the acetates were thoroughly identified by spectral data.

Scheme 3. a) $\mathrm{NaBH}_{4}, \mathrm{CeCl}_{3} \cdot \mathrm{H}_{2} \mathrm{O}$, Et $\mathrm{OH}, 0{ }^{\circ} \mathrm{C}$ to RT , b) $\mathrm{Ac}_{2} \mathrm{O}-\mathrm{Py}$, c) $\mathrm{OsO}_{4}-\mathrm{NMO}$, $\mathrm{CH}_{3} \mathrm{COCH}_{3}: \mathrm{H}_{2} \mathrm{O}(3: 1)$.

Stereoselective cis-hydroxylation of the olefins $\mathbf{1 6 - 2 0}$ was affected using $\mathrm{OsO}_{4}-\mathrm{NMO}$ in acetone-water (3:1) system to afford the diols 22-26. The stereochemical outcome, anti-to the OAc group, is in accordance with literature ${ }^{21}$ precedence. Acetylation of diols 22-26 with acetic anhydride in pyridine afforded the corresponding pseudo saccharide precursors 1-5 in quantitative yields.

The structures of 1-5 were fully confirmed with the help of detailed NMR analysis using the vicinal couplings ( J ) as well as the data from the NOESY experiments. For compound 1, the characteristic NOE cross peaks (Figure 2) H6-H8, H6-H10a, H8-H10a and H7-H5 and $\mathrm{J}_{5,6}, \mathrm{~J}_{6,7}$, $\mathrm{J}_{7,8}$ and $\mathrm{J}_{5,10 \mathrm{a}}$ values of about 10 Hz are in consensus with a chair conformation, ${ }^{8} \mathrm{C}_{5}$, for the carbocycle ring. Interestingly, most of the substituents in this conformation take energetically favored equatorial position. For compound 2, the structure and conformation are supported by strong NOE cross peaks between $\mathrm{H} 5-\mathrm{H} 9$ and $\mathrm{H} 6-\mathrm{H} 10 \mathrm{a}$ as well as large value of about 10 Hz for $\mathrm{J}_{5,6}, \mathrm{~J}_{5,10 \mathrm{a}}$ and $\mathrm{J}_{9,10 \mathrm{a}}$ whereas large NOE cross peaks between $\mathrm{H} 5-\mathrm{H} 7$ as well as $\mathrm{J}_{5,10 \mathrm{a}} 13.0 \mathrm{~Hz}$ and $\mathrm{J}_{7,8} 10.8 \mathrm{~Hz}$ confirm the structure of compound 3.

Figure 2. Diagramatic representation of NOEs.
Such a conformation for the carbocycle ring is again energetically favored, as apart from substituent at C-6 and C-9, all the substituents are placed equatorial. For compound 4 the characteristic NOE cross peaks H6-H10a and $\mathrm{H} 5-\mathrm{H} 9$ as well as large value of about 10 Hz for $\mathrm{J}_{9}$, ${ }_{10 \mathrm{a}}$ and $\mathrm{J}_{5,10 \mathrm{a}}$ and 9.8 Hz for $\mathrm{J}_{5,6}$ are in conformity with a chair conformation, while for 5 , the
structure and conformation are supported by strong NOE cross peaks between H5-H7, H8-H10a and $\mathrm{J}_{5,10 \mathrm{a}}$ and $\mathrm{J}_{7,8}$ of about 10 Hz . The six membered rings in all these molecules take ${ }^{8} \mathrm{C}_{5}$ chair conformation. The five membered ring is puckered in all the compounds. Small values of $\mathrm{J}_{1,2}, \mathrm{~J}_{2,3}$ and $\mathrm{J}_{3,4}$ point out to a twist conformation for the sugar ring. The presence of NOE cross peaks between $\mathrm{H} 1-\mathrm{Me}(\mathrm{A}), \mathrm{H} 2-\mathrm{Me}(\mathrm{A})$ and $\mathrm{H} 4-\mathrm{Me}(\mathrm{B})$ implies an envelop conformation for the five membered ring containing isopropylidine group. The relative orientation of the carbocycle and sugar rings is derived with the help of NOESY experiments. For 1-3 the strong NOE cross peaks between $\mathrm{H} 3-\mathrm{H} 10 \mathrm{e}, \mathrm{H} 4-\mathrm{H} 10 \mathrm{a}$, and weak NOE cross peaks between $\mathrm{H} 3-\mathrm{H} 10 \mathrm{a}$ and $\mathrm{H} 4-\mathrm{H} 10 \mathrm{e}$ and H10e-OMe confirm the structures shown in Figure 2. For 4 and 5, on the other hand, there is change in configuration at C5 and the NOE cross peak between H3-H6 and H4-H6 support relative orientation of the rings. Molecular mechanics study is carried out on 1-5 using Sybyl ${ }^{22}$ and the results obtained agree with the experimental data. Dihedral angle H4-C4-C5-H5 of about $170^{\circ}$ for $\mathbf{1 - 3}$ and 5 (Figure 3) is consistent with large $\mathrm{J}_{4,5}$ of about 10 Hz . For 4 the calculated dihedral angle $\mathrm{H} 4-\mathrm{C} 4-\mathrm{C} 5-\mathrm{H} 5$ of $-129^{\circ}$ is conformity in experimentally observed $\mathrm{J}_{4,5} 4.3 \mathrm{~Hz}$.

These observations are in agreement with the experimental data supporting the trans stereochemistry across the rings.

Figure 3. Structures obtained from energy minimization for 1-5. (Note: For clarity in visualization the protecting groups are not shown in the figure).

Thus, pseudo saccharide precursors 1-5 were synthesised by adopting an 'off template site' stereoselective $[3+3]$ annulation approach, where the chirality of the carbocycle is induced from the sugar template. In this present [3+3] annulation protocol, Michael-Wittig reaction was exploited for the first time in carbohydrate chemistry for the installation of carbocycle ring system at C-5 of sugar synthon. Due to the ready availability of reagents and simple reaction conditions, the present protocol and the pseudo saccharide precursors $\mathbf{1 - 5}$ should find a wide use in the synthesis of several C-glycoside mimics towards the bioactive carbohydrates.

The organic layer was washed with water $(50 \mathrm{~mL})$, brine $(50 \mathrm{~mL})$ and dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$. Evaporation of solvent under reduced pressure and purification of the residue by column chromatography (finer than 200 mesh Si-gel, Ethyl acetate: Pet. ether 1:4) gave the title compounds 6a-d ( 2.23 g ) in $75 \%$ yield as partially separable mixtures 6a, b $(1.66 \mathrm{~g}, 56 \%)$ and $\mathbf{6 c}$, $\mathbf{d}(0.56 \mathrm{~g}, 19 \%)$.
