#### Abstract

A simple and efficient asymmetric synthesis of $(R)-(-)$-octopamine $\mathbf{1},(R)-(-)$-tembamide 2 and $(R)-(-)$-aegeline 3 is described for the first time employing the Sharpless asymmetric dihydroxylation (AD) as the source of chirality. © 2006 Elsevier Science Ltd. All rights reserved.

## Introduction

$(R)-(-)$-Octopamine $\mathbf{1}$ is a potent chiral drug possessing $\beta$-adrenergic activity. ${ }^{1}(R)-(-)-$ Tembamide 2 and $(R)$-(-)-aegeline 3 are used in traditional Indian medicines and have been shown to have good hypoglycemic activity. ${ }^{2}$ Recent studies have revealed that the two enantiomers of a chiral drug usually display different biological activities ${ }^{3}$ and in most of the aryl ethanolamine drugs, the biological activity resides mainly in the $(R)$-enantiomer. ${ }^{4}$ The growing need and interest in the asymmetric synthesis of these biologically useful molecules prompted us to take up their synthesis.

Various methods for the synthesis of optically active $(R)-(-)$-octopamine $1,{ }^{5}(R)-(-)-$ tembamide 2 and $(R)-(-)$-aegeline $3^{6}$ have been documented. These include either tedious chemical and biological methods ${ }^{7}$ or require the costly reagents and multistep processes with overall low chemical yields. ${ }^{8}$ Recently the enzymatic reduction of $\alpha$-bromo ketones ${ }^{9 \mathrm{a}}$ and $\alpha$-azido ketones $^{9 b}$ has also been reported for their synthesis. Surprisingly there has been no report in the literature about the asymmetric synthesis of these compounds employing the Sharpless asymmetric dihydroxylation (AD) procedure. As part of our research program aimed at developing enantioselective syntheses of naturally occurring lactones, ${ }^{10 \mathrm{abc}}$ and amino alcohols, ${ }^{10 \mathrm{~d}-}$ ${ }^{\mathrm{k}}$ and the AD was envisaged as a powerful tool to chiral dihydroxy compounds offering
considerable opportunities for synthetic manipulations. Herein we report a new and highly enantioselective synthesis of $(R)-(-)$-octopamine $\mathbf{1},(R)-(-)$-tembamide 2 and $(R)-(-)$-aegeline 3 employing the AD reaction as the source of chirality.

## Results and Discussion

Scheme 1 , depicts the synthetic route to $(R)-(-)$-octopamine 1 from the commercially available 4-hydroxybenzaldehyde (4). The hydroxyl protection of 4 as benzyl ether and subsequent Wittig olefination furnished styrene 5 in excellent yield. ${ }^{10 \mathrm{i}}$ Asymmetric dihydroxylation ${ }^{11}$ of 5 using osmium tetroxide and $\mathrm{K}_{3} \mathrm{Fe}(\mathrm{CN})_{6}$ as co-oxidant in the presence of 1,4-bis(dihydroquinidin-9-Oyl)phthalazine [(DHQD) $)_{2} \mathrm{PHAL}$ ] gave the diol 6 in $94 \%$ yield. Selective conversion of the primary hydroxyl group of $\mathbf{6}$ into a tosylate was carried out using tosyl chloride in pyridine at $15^{\circ} \mathrm{C}$ to give 7 in $76 \%$ yield. The nucleophilic displacement of tosylate 7 with $\mathrm{NaN}_{3}$ afforded the azido alcohol 8, having $[\alpha]_{\mathrm{D}}{ }^{20}-68.4\left(\mathrm{c} 0.5, \mathrm{CHCl}_{3}\right)^{12}\left\{\right.$ lit. ${ }^{5}[\alpha]_{\mathrm{D}}{ }^{20}-72.2$ (c 1.1, $\left.\left.\mathrm{CHCl}_{3}\right)\right\}$. Subsequent reduction of azide and debenzylation of 8 by catalytic hydrogenation on $10 \%$ $\mathrm{Pd}(\mathrm{OH})_{2} / \mathrm{C}$ at 60 psi furnished $(R)-(-)$-octopamine having $[\alpha]_{\mathrm{D}}{ }^{20}-35.7\left(\mathrm{c} 0.54, \mathrm{H}_{2} \mathrm{O}\right)\left\{\mathrm{lit} .^{5}[\alpha]_{\mathrm{D}}{ }^{20}\right.$ -37.6 (c 0.56, $\left.\left.\mathrm{H}_{2} \mathrm{O}\right)\right\}$.

The synthetic route to $(R)-(-)$-tembamide 2 and $(R)-(-)$-aegeline $\mathbf{3}$ is shown in Scheme 2 . The synthesis starts from 4-methoxystyrene (9), a commercially available starting material. Asymmetric dihydroxylation of $\mathbf{9}$ with (DHQD) ${ }_{2}$ PHAL ligand gave the diol 10 in $93 \%$ yield and $97.5 \%$ ee. ${ }^{13}$ Selective conversion of primary hydroxyl into tosylate $\mathbf{1 1}$ and nucleophilic displacement with $\mathrm{NaN}_{3}$ gave the azido alcohol 12. Reduction of azide 12 by hydrogenation over $10 \%$ palladium on charcoal in methanol furnished the amino alcohol which on subsequent acylation with benzoyl chloride in presence of $50 \%$ aq. NaOH gave $(R)$-(-)-tembamide 2 in $92 \%$ yield having $[\alpha]_{\mathrm{D}}{ }^{20}-60.45\left(\mathrm{c} 0.52, \mathrm{CHCl}_{3}\right)\left\{\mathrm{lit.}^{9 \mathrm{~b}}[\alpha]_{\mathrm{D}}{ }^{25}-59.6\right.$ (c $\left.\left.0.52, \mathrm{CHCl}_{3}\right)\right\}$. In a similar manner, the reaction of amino alcohol with cinnamoyl chloride provided $(R)$-(-)-aegeline $\mathbf{3}$ in $90 \%$ yield having $[\alpha]_{D}{ }^{20}-35.21$ (c $0.4, \mathrm{CHCl}_{3}$ ) $\left\{\mathrm{lit.}^{9 \mathrm{~b}}[\alpha]_{\mathrm{D}}{ }^{25}-36.1\left(\mathrm{c}=0.45, \mathrm{CHCl}_{3}\right)\right\}$. The spectroscopic data of $\mathbf{2}$ and $\mathbf{3}$ are in full agreement with the literature data. ${ }^{9 b}$

## Conclusions

In summary, a practical and highly enantioselective synthesis of (-)-octopamine, (-)-tembamide and (-)-aegeline has been achieved for the first time employing the Sharpless asymmetric dihydroxylation as the source of chirality. Thus, the results described herein constitute a short and efficient route to (-)-octopamine, (-)-tembamide and (-)-aegeline. The synthetic approach can be further extended to the asymmetric synthesis of $(S)$-enantiomers via $\alpha$-dihydroxylation of 5 and $\mathbf{9}$ and following the reaction sequence, as shown in Schemes 1 and 2.

## Experimental Section

General Procedures. Solvents were purified and dried by standard procedures before use; petroleum ether of boiling range $60-80^{\circ} \mathrm{C}$ was used. Melting points are uncorrected. Optical rotations were measured using sodium D line on a JASCO P-1020 microprocessor based polarimeter. Infrared spectra were recorded on ATI MATTSON RS-1 FT-IR spectrometer. ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on Bruker AC-200 spectrometer. Mass spectra were obtained with a TSQ 70, Finningen MAT mass spectrometer. Elemental analyses were carried out on a Carlo Erba CHNS-O analyzer.

The organic layer was separated and the aqueous layer extracted with $\operatorname{EtOAc}(3 \times 20 \mathrm{~mL})$. The combined organic layers were washed (water and then brine) dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated. The residue was purified by silica gel column chromatograpy using petrol ether:EtOAc (17:3) as eluent to give azido alcohol $12(278 \mathrm{mg}, 93 \%)$ as a colorless oil; $[\alpha]_{\mathrm{D}}{ }^{20}-77.11\left(c 1, \mathrm{CHCl}_{3}\right)\left\{\right.$ lit. $^{5}[\alpha]_{\mathrm{D}}{ }^{20}-117.4$ (c 1.30, $\mathrm{CHCl}_{3}$ ), lit. $\left.{ }^{9 \mathrm{~b}}[\alpha]_{\mathrm{D}}{ }^{20}-40.1\left(c 1.02, \mathrm{CHCl}_{3}\right)\right\}$; IR $\left(\mathrm{CHCl}_{3}\right): v_{\max } 3441,2934,2105,1612$, 1513, 1250, 832, $493 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}$ NMR ( $200 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 2.18(\mathrm{~s}, 1 \mathrm{H}), 3.35-3.5(\mathrm{~m}, 2 \mathrm{H}), 3.82$ $(\mathrm{s}, 3 \mathrm{H}), 4.8-4.87(\mathrm{dd}, J=2,6 \mathrm{~Hz}, 1 \mathrm{H}), 6.94(\mathrm{~d}, J=8 \mathrm{~Hz}, 2 \mathrm{H}), 7.33(\mathrm{~d}, J=8 \mathrm{~Hz}, 2 \mathrm{H}),{ }^{13} \mathrm{C}$ NMR ( $50 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 55.17,57.85,72.81,113.94$ (2C), 127.1 (2C), 132.8, 159.45 ; EIMS ( $\mathrm{m} / \mathrm{z}, \%$ ): $193\left[\mathrm{M}^{+}\right]$(7.16), 162 (1.3), 137 (100), 109 (45.8), 94 (43.8), 77 (47.7), 66 (23.8); Anal. (R)-(-)-Tembamide (2). To a solution of azido alcohol 12 ( $500 \mathrm{mg}, 2.58 \mathrm{mmol}$ ) in MeOH ( 5 mL ) was added $10 \% \mathrm{Pd} / \mathrm{C}(20 \mathrm{mg})$ and the reaction mixture stirred at room temperature under hydrogen atmosphere (filled in a balloon) for 8 h . The catalyst was removed by filtration and the filtrate concentrated to give the amino alcohol. The residue was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(4 \mathrm{~mL})$ and a solution of $50 \%$ aq $\mathrm{NaOH}(713 \mathrm{mg})$ in water $(5 \mathrm{~mL})$ was added at $0^{\circ} \mathrm{C}$ and stirred for 15 min . To the reaction mixture was added a solution of benzoyl chloride ( $0.37 \mathrm{~mL}, 3.23 \mathrm{mmol}$ ) in dry toluene ( 2 mL ) dropwise and stirred for further 1 h . The solvent was removed in vacuo and the residue was diluted with cold water and extracted with EtOAc $(3 \times 50 \mathrm{~mL})$. The combined organic layers were washed (brine) dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated. The residue was purified by silica gel column chromatography using petrol ether:EtOAc (1:1) to give $2(645 \mathrm{mg}, 92 \%)$ as
a colorless solid. It was further recrystalized from petrol ether:EtOAc.
