#### Abstract

4-Coumarinsulfonamide 5c and 4-hydroxy-3-coumarinsulfonamide 7b, were prepared from 4hydroxycoumarin 1. Coumarinsulfonamide 5c was served as intermediate for the synthesis of N -(isopropylphenyl)- N -(coumarin-4-sulfonyl)urea $\mathbf{9}$ and N -(4-bromphenyl-), 8a, N -(1,3,4-thiadiazol-2-yl-), 8b, and $N$-(4-isopropylphenyl)-4-aminocoumarin 8c.

Keywords: Coumarin sulfonamides, coumarin sulfonylureas, aminocoumarins

## Introduction

Sulfonylurea herbicides posses herbicidal activity at unprecendent levels combined with very low mammalian toxicity and desirable environmental properties. ${ }^{2}$ The synthesis and SAR-study of a great number of sulfonylureas have shown that maximum herbicidal activity is found in compound having an ortho substituted aryl group next to unmodified sulfonylurea bridge and with the heterocycle as a pyrimidine or 1,3,5-triazine with methyl or methoxy in the 4 and 6 positions. ${ }^{3}$

## ARYL-SO ${ }_{2}$-NH-CO-NH-HETEROCYCLE

I

Our research effort has been focused on substitution of the ARYL part of general formula I by the coumarin moiety.

A comprehensive review of the syntheses of sulfonylureas and their intermediates has been published by Beyer et. al. ${ }^{4}$ The overall synthesis of these sulfonylureas involves preparation of the sulfonamide and their coupling reactions with isocyanate derivatives.

## Results and Discussion

The coumarinsulfonamide $\mathbf{5 c}$ is a key intermediate that required to prepare the target product of type I. 4-Chlorocoumarin 2a was prepared from 4-hydroxycoumarin 1. It is known, that the selectivity of the reaction of $\mathbf{1}$ with $\mathrm{POCl}_{3}$ is low, ${ }^{6,7}$ because a considerable amount of 4-chloro$3,4^{\prime}, 3^{\prime}, 4^{\prime \prime}$-tercoumarin $\mathbf{3}$ was formed as a by-product. Our method improved the yield of the $\mathbf{2 a}$ and significantly decreased yield of the $\mathbf{3}$. ${ }^{1} \mathrm{H}-\mathrm{NMR}$ of the $\mathbf{3}$ clearly shows three doublets with a typical ortho interaction constant ( $5,5^{\prime}, 5^{\prime \prime}-\mathrm{H}$ ) and a singlet for $3^{\prime \prime}-\mathrm{H} .{ }^{13} \mathrm{C}-\mathrm{NMR}$ (DEPT) spectra indicate the presence of 14 quaternary carbons and 13 tertiary ( $\mathrm{C}-\mathrm{H}$ ) ones. Quaternary carbons are in positions 3 and 4 on the two of three $\alpha$-pyrone skeletons. Mass spectrum showed a molecular weight of 468 , which was consistent with the elemental analysis.

The key intermediate, 4-isopropylthiocoumarin 2c was easily prepared from 4chlorocoumarin 2a using sodium 2-propanethiol. Oxidation of 2c by chlorine in acetic acid, and subsequent transformation of the sulfonylchloride 5a by different amines led to the sulfonamides $\mathbf{5 b}, \mathbf{5}$ c. Attempted oxidation of the 4-ethylthiocoumarin $\mathbf{2 b}$ under the same condition led mainly to the 3,4-dichlorocoumarin 4.

The most selective and effective way to the sulfonamide $\mathbf{5 c}$ was via the preparation of $\mathrm{N}-t$ butyl coumarinsulfonamide $\mathbf{5 b}$, with subsequent removal of the $t$-butyl group with trifluoroacetic acid (TFA).

Chlorosulfonation of $\mathbf{1}$ exclusively produced 3-coumarinsulfonic acid $\mathbf{6}$ which was further converted to sulfonamide 7b (Scheme 1).

A very convenient method for the preparation of sulfonylureas is the diazabicycloundecene (DBU) catalyzed condensation of an arylsulfonamide with a phenoxycarbamate. Other route (Meyer and Fory method) involved the heating of a phenylcarbamate of the sulfonamide with arylamines and heteroamines. ${ }^{5}$

According to the method reported by Meyer and Fory, we have obtained 4-substituted aminocoumarins 8a and 8b (Scheme 2).

The attempted condensation of coumarinsulfonamide $\mathbf{5 c}$ with 4-isopropylphenylisocyanate using diazabicyclononene ( DBN ) led only to 4 -aminosubstituted coumarin 8c. The $\mathrm{SnCl}_{4}$ catalyzed reaction of $\mathbf{5 c}$ with the isocyanate provides desired sulfonylurea 9 (Scheme 3).

## Experimental Section

General Procedures. Flash chromatography was carried out on $0.04-0.063 \mathrm{~mm}$ (Merck) silica gel, thin layer chromatography was carried out on aluminum back silica plates by Merck and plates were viewed in UV254 light. IR-spectra were recorded on a Philips Analytical PU 9800 spectrometer. ${ }^{1} \mathrm{H}-\mathrm{NMR}(300 \mathrm{MHz})$ and ${ }^{13} \mathrm{C}-\mathrm{NMR}(75 \mathrm{MHz})$ spectra were recorded on a Varian VXR 300 instrument at $293{ }^{\circ} \mathrm{K}$ in $\mathrm{CDCl}_{3}$ or DMSO D-6. Spectra were internally referenced to TMS. Peaks are reported in ppm downfield of TMS. Multiplicities are reported as singlet (s), doublet (d), triplet ( t ), quartet ( q ), some combinations of these were made by DEPT editing of the spectra. The MS-spectra were recorded on a AEI MS 902 S electron ionization spectrometer $(E I=70 \mathrm{eV})$. The elemental analysis, were performed on a Perkin-Elmer 2400 spectrometer.

Materials. The 4-hydroxycoumarin 1, ethanethiol, 2-propanethiol, trifluoroacetic acid (TFA), chlorosulfonic acid $\left(\mathrm{ClSO}_{3} \mathrm{H}\right), \mathrm{POCl}_{3}$ were purchased from Fluka, and $\mathrm{Bu}_{\mathrm{t}} \mathrm{NH}_{2}$ was purified, dried and distillated prior to use.
4-Chlorocoumarin (2a). 4-hydroxycoumarin $\mathbf{1}(30 \mathrm{~g}, 0.185 \mathrm{~mol})$ and $60 \mathrm{~mL} \mathrm{POCl}{ }_{3}$ were refluxed for 1 h , cooled, and slowly poured onto crushed ice ( 700 g ) with vigorous stirring. The solid was collected by filtration and washed successively with ice-water. Azeotropic distillation with i-hexane, hot filtration of the by-product ( $15 \mathrm{~g}, 17 \%$ ), ${ }^{7}$ followed by evaporation of solvent and crystallization yielded $21.9 \mathrm{~g}(65 \%)$ of 4-chlorocoumarin with $\mathrm{mp} 87-89^{\circ} \mathrm{C}\left(\right.$ lit. $\left.^{6} 89-91^{\circ} \mathrm{C}\right)$. ${ }^{1} \mathrm{H}-\mathrm{NMR} \delta 7.88-7.30(4 \mathrm{H}, \mathrm{m}, \mathrm{ar}-\mathrm{H}), 6.62(1 \mathrm{H}, \mathrm{s}, 3-\mathrm{H})$; IR v 3098, 3069, 3040, 1754, 1721, 1611, 1603, 1449, 1348, 1273, $1177 \mathrm{~cm}^{-1}$; MS m/z: 182 (23), $180(\mathrm{MH}+, 77), 154$ (31), 152 (100), 89 (85), 63 (46), 62 (31), 39 (19).
