#### Abstract

Highly practical and efficient synthesis of ( $2 S, 3 R, 4 R, 5 S$ )-5-(tert-butyloxycarbonyl)amino-2,3,4,6-tetrahydroxyhexanoyl- $\beta$-D-phenylalanine methyl ester was achieved using easily available Garner aldehyde and phenylglycine, which is an advanced intermediate for the synthesis of pyloricidins.

Keywords: Amino acids, antibiotic, dihydroxylation, homologation, debenzylation

## Introduction

The pyloricidins 1, isolated ${ }^{1}$ from soil samples of Bacillus sp. HC-70 and Bacillus sp. HC-72, have shown exceptional anti-Helicobacter pylori antibiotic properties. ${ }^{2}$ Helicobacter pylori, a gram-negative bacterium, infection of this is the major causative factor of a number of gastric and duodenal pathologies. Several classes of compounds have been identified as anti-H. Pylori agents. Incomplete eradication of $H$. pylori has been achieved with some anti-microbial agents such as amoxicillin and clarithromycin due to their degradation by gastric acid. Efforts have been directed to develop or isolate new series of compounds having antibiotic properties, which can totally eradicate this bacteria. ${ }^{3}$ Naturally, the pyloricidin class of molecules have attracted attention of synthetic and medicinal chemistry groups. The first synthesis of pyloricidin $\mathbf{1}$ has recently been achieved by Hasuoka et al., using chiron approach starting from D-galactosamine hydrochloride. ${ }^{4}$

As a part of our continued interest in developing simple and elegant strategies for the synthesis of bioactive natural and unnatural products, ${ }^{5}$ especially combining chiron approach with asymmetric synthesis, herein, we disclose the full findings on the N - and C - terminal
protected ( $2 S, 3 R, 4 R, 5 S$ )-5-amino-2,3,4,6-tetrahydroxyhexanoyl phenylalanine, which constitutes the key backbone of pyloricidins. This synthesis was taken up as part of designing new hybrid analogues of peptide bioactives. The easily available L-phenylglycine $\mathbf{1 3}$ and Garner aldehyde $\mathbf{6}$ were effectively transformed to the target compound 2 involving very straightforward transformations.

## Results and Discussion

In formulating the synthetic plan for 2, we envisioned an amide bond formation between the acid 4 and amine 5, followed by deprotection of acetonide and benzyl groups allowing the synthesis of target compound 2 (scheme 1).

## Scheme 1

Synthesis of acid 4 started from readily available Garner aldehyde 6. ${ }^{6}$ Grignard reaction of Garner aldehyde 6 with vinylmagnesium bromide in tetrahydrofuran at $-78^{\circ} \mathrm{C}$ gave the allyl alcohols 8 and 7 with 1:6 syn-anti selectivity. ${ }^{7}$ The two diastereomers were separated by silica gel column chromatography. The ratio of the isomers was determined based on the weight of products isolated. Inversion of hydroxy group in alcohol 7 under Mitsunobu conditions ${ }^{8}$ using triphenylphosphine/diethyl azodicarboxylate and 4-nitrobenzoic acid in THF at $0{ }^{\circ} \mathrm{C}$ to room temperature and followed by hydrolysis of nitro benzoate with $\mathrm{K}_{2} \mathrm{CO}_{3}$ in MeOH produced the syn alcohol 8 in $30 \%$ yield for two steps. The spectral data (optical rotation and ${ }^{1} \mathrm{H}$ NMR) of compound 8 and minor diastereomer obtaind during vinylation of Garner aldehyde were
comparable confirming the inversion of hydroxy group. Allylic hydroxy group of compound $\mathbf{8}$ was protected as benzyl ether using NaH and benzyl bromide in THF. Dihydroxylation of olefin 9 using $\mathrm{OsO}_{4}$ and NMO in acetone: $\mathrm{H}_{2} \mathrm{O}(8: 2)$ afforded the diol 10. After periodate oxidation of diol 10, the resultant aldehyde was treated with (carboethoxymethylene)triphenylphosphorane in benzene to afford the unsaturated ester 11. Ester $\mathbf{1 1}$ was dihydroxylated using $\mathrm{OsO}_{4}$ and NMO in acetone:water (8:2) to furnish the diol 12 with $13: 1$ diastereomeric ratio. ${ }^{9}$ This ratio was determined using hypersil OD reverse phase column and MeOH: water / 70: 30 as eluents at 254 nm.

Hydrolysis of the diol 12 using LiOH. $\mathrm{H}_{2} \mathrm{O}$ gave the dihydroxy acid 4 (Scheme 2).

## Scheme 2

$\beta$-Phenylalanine methyl ester 5 was prepared from phenylglycine 13. ${ }^{10}$ Homologation of N Boc protected phenyl glycine with ethyl chloroformate, triethylamine, $\mathrm{CH}_{2} \mathrm{~N}_{2}$ and silverbenzoate in MeOH followed by deprotection of Boc group with trifluoroacetic acid in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and subsequent basification with $\mathrm{Na}_{2} \mathrm{CO}_{3}$ gave the $\beta$-phenylalanine methyl ester 5. Amide bond between acid 4 and amine 5 using dicyclohexyl carbodiimide, hydroxy benzotriazole in methylenechloride furnished the amide 3 in $60 \%$ yield. Deprotection of acetonide group under acidic conditions $(80 \% \mathrm{AcOH})$ gave the triol 15. Finally, debenzylation of the triol 15 yielded the target compound 2 (scheme 3 ).

## Conclusions

An efficient synthesis of ( $2 S, 3 R, 4 R, 5 S$ )-5-(tert-butyloxycarbonyl)amino-2,3,4,6-tetrahydroxyhexanoyl- $\beta$-D-phenylalanine methyl ester 2 is described from easily available building blocks ( $\mathbf{6}$ and 13). This is a common precursor for the synthesis of all the pyloricidins. This synthesis allows one to prepare various peptide analogs of the target compound for designing robust antibiotics.

## Experimental Section

General Procedures. Optical rotations were measured with a JASCO DIP-360 Polarimeter at $26{ }^{\circ} \mathrm{C}$ and IR spectra were recorded with a Perkin Elmer FTIR spectrophotometer. ${ }^{1} \mathrm{H}$ NMR spectra were carried out using a Varian Gemini 200, Varian Unity 400 and Bruker Avance 300 MHz spectrophotometer using TMS as an internal standard in $\mathrm{CDCl}_{3}$. Mass spectra were recorded on Micro mass VG-7070H for EI and VG Autospec M for FABMS mass spectrometers. The progress of all the reactions was monitored by thin-layer chromatography (TLC) using glass plates precoated with silica gel $60 \mathrm{~F}_{254}$ to a thickness of 0.25 mm (Merck). Column chromatography was conducted by elution of columns with silica gel $60-120$ mesh using ethyl acetate and hexane as eluents.

 (7). To a $-78{ }^{\circ} \mathrm{C}$ solution of Garner aldehyde $6(5 \mathrm{~g}, 0.021 \mathrm{~mol})$ in dry THF ( 100 mL ) under $\mathrm{N}_{2}$ was added vinylmagnesium bromide [prepared from vinyl bromide ( $6.94 \mathrm{~g}, 0.065 \mathrm{~mol}$ ) and magnesium ( $1.57 \mathrm{~g}, 0.065 \mathrm{~mol}$ ) in dry THF] over a 30 min period. The solution was stirred for 2 h at $-78{ }^{\circ} \mathrm{C}$ when the TLC in hexane : ethylacetate (2:1) showed the clean formation of the product. The solution was warmed to $0{ }^{\circ} \mathrm{C}$ and partitioned between 60 mL of saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution and 2 X 300 mL of $\mathrm{Et}_{2} \mathrm{O}$. The combined organic layers were washed with 100 mL of brine, dried with anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated in vacuo and crude residue was chromatographed on silica gel using hexane:ethyl acetate (8:1) as an eluent to give $6: 1$ mixture of alcohols 7 and 8 as colorless oil. Alcohols $7(4 \mathrm{~g}, 71 \%)$ and $8(0.67 \mathrm{~g}, 12 \%)$ were further separated by column chromatography on silica gel using ethyl acetate: hexane (1:16) as an eluent (The column chromatography was performing on a glass column of length 50 cm and diameter 28 mm with gravity). $[\alpha]_{\mathrm{D}}{ }^{25}=-54.8^{\circ}(\mathrm{c}=2.1 \mathrm{in} \mathrm{MeOH}) ;{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 200 \mathrm{MHz}\right)$ of 7: $\delta$ 5.93-5.72 (m, 1H), 5.42-5.15 (m, 2H), 4.30-3.80 (m, 5H (including OH)), $1.53(\mathrm{~s}, 3 \mathrm{H}), 1.51(\mathrm{~s}$, 3H), 1.45 (s, 9H); IR (KBr): 3453, 2979, 1699, 1457, 1258, $993 \mathrm{~cm}^{-1}$; FABMS: m/z 258 (M+1); Anal. The organic layer was separated and aqueous layer extracted with chloroform $(2 \times 10 \mathrm{~mL})$. The combined organic extracts were washed with water and brine. After drying over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The solvent was removed under vaccuo and crude residue was purified by silicagel column chromatography to give ester $15(0.055 \mathrm{~g}, 60 \%) .[\alpha]_{\mathrm{D}}{ }^{25}=26.19^{\circ}$ (c $=1 \mathrm{in}$ $\mathrm{MeOH}) ;{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 200 \mathrm{MHz}\right): \delta 7.65(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.40-7.20(\mathrm{~m}, 10 \mathrm{H}), 5.50-5.30$ $(\mathrm{m}, 2 \mathrm{H}), 4.65(\mathrm{~s}, 2 \mathrm{H}), 4.45(\mathrm{bs}, 1 \mathrm{H}), 4.30-4.15(\mathrm{~m}, 2 \mathrm{H}), 4.12-3.70(\mathrm{~m}, 3 \mathrm{H}), 3.65(\mathrm{~s}, 3 \mathrm{H}), 2.80(\mathrm{~d}$, $J=8.5 \mathrm{~Hz}, 2 \mathrm{H}$ ), $1.62(\mathrm{bs}, 2 \mathrm{H},-\mathrm{OH}), 1.40(\mathrm{~s}, 9 \mathrm{H}){ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): 174.8, 173.6, $157.4,142,138.6,130,129.5,129.2,128.5,128,127.4,84.2,82.2,75,73.8,82.4,62.5,54,53$, 50, 42, 29); IR (KBr): 3443, 2950, 1680, 1640,1239 cm ${ }^{-1}$; HRMS (FAB) Calcd for $\mathrm{C}_{28} \mathrm{H}_{38} \mathrm{~N}_{2} \mathrm{O}_{9}$ $\left(\mathrm{M}^{+}\right) 547.2655$ Found : 547.2659.
