#### Abstract

Several pterin derivatives (1-8) have been ribosylated in form of their trimethylsilyl derivatives (9) with 1-bromo-(10) and 1-O-acetyl-2,3,5-tri-O-benzoyl-D-ribofuranose (11) under the catalysis of $\mathrm{HgO} / \mathrm{HgBr}_{2}, \mathrm{BF}_{3}$-etherate and trimethylsilyl triflate, respectively. Mixtures of the $\mathrm{N}-1-(19-25)$ and $\mathrm{N}-3$-ribofuranosides (12-18) which are difficult to be separated were obtained. Debenzoylation by the Zemplen method led to the free pterin-nucleosides (28-30). A second approach starting from 2-methylthio-4(3H)pteridinones (31-33) gave again mixtures of the $\mathrm{N}-1$-(35-37) and $\mathrm{N}-3$-ribonucleosides (38-40). The 2-methylthio function in 35-37 can easily be substituted by various amines leading after subsequently debenzoylation to the N-2substituted pterin-ribonucleosides (41-50). The structural assignments were based on comparisons of the UV spectra with the corresponding N-methyl substituted model substances. ${ }^{1}$ H-NMR-spectra functioned as additional structural proof.

## Introduction

The synthesis of pteridine nucleosides has been a major subject in our laboratory for many years. Lumazine ${ }^{2-11}$ and isopterin nucleosides ${ }^{12}$ can be regarded as structural analogs of the pyrimidine nucleosides whereas the many pteridin-7-one $\mathrm{N}_{8}$-nucleosides ${ }^{13-23}$ are structurally related to the purine nucleosides. The syntheses could be achieved either by a classical Hilbert-Johnson reaction ${ }^{24}$, the mercury salt method by Fox and Davoll ${ }^{25}$, the Hilbert-Johnson-Birkofer silyl procedure ${ }^{26,27}$ or the silyl variant by Vorbrüggen ${ }^{28}$.
Pterin (2-amino-4(3H)pteridone) (1), the basic molecule of most naturally occurring pteridine derivatives, has so far not been included in our investigations. Thin layer chromatographic analysis of the reaction mixture obtained from preliminary experiments with $\mathbf{1}$ suggested that the reaction is not straightforward; formation of a complex mixture of several reactions products was thereby indicated.

## Synthesis

Starting with 6,7-diphenylpterin (2) silylation with hexamethyldisilazane took 6 days till all starting material had dissolved to form 2-trimethylsilylamino-4-trimethylsilyloxypteridine (9) which was first treated with 1-bromo-2,3,5-tri-O-benzoyl-D-ribofuranose (10) in presence of HgO and $\mathrm{HgBr}_{2}$ in analogy to the conditions of Wittenburg ${ }^{29}$. After a very tedious chromatographic separation by column, low-pressure and preparative thick layer chromatography three compounds 2 -amino-6,7-diphenyl-3-(-(2,3,5-tri-O-benzoyl- $\beta$-D-ribofuranosyl) $-4(3 \mathrm{H})$-pteridone (12), the corresponding $\mathrm{N}^{1}$-riboside (19) and the 2 -imino-6,7-diphenyl- $\mathrm{N}^{1}, O^{4}$-bis-(2,3,5-tri-O-benzoyl- $\beta$-D-ribofuranosyl)-1,2-dihydropteridine (26) could be isolated in low yields. An analogous reaction with 1-O-acetyl-2,3,5-tri-O-benzoyl- $\beta$-Dribofuranose (11) and $\mathrm{BF}_{3}$ - etherate as a catalyst gave predominately 2-amino-6,7-diphenyl-1-(2,3,5-tri-O-benzoyl-ß-D-ribofuranosyl)-4(3H)pteridone (19) in $50 \%$ yield whereas the isomeric 12 was obtained in only $1 \%$ yield.

Analogously, $\mathrm{BF}_{3}$-catalysis of 7-phenylpterin (7) and 11 gave small amounts of the $\mathrm{N}_{1}$ - (23) and $\mathrm{N}_{3}$-nucleoside (17). Similarly 6-phenylpterin (6) and 11 in presence of trimethyl-silyl trifluorosulfonate gave three components $\mathrm{N}_{1}-(22), \mathrm{N}_{3}$-monoriboside (16) and the $\mathrm{N}_{1}, O^{4}$ diriboside (27) that were separated from the complex reaction mixture. Ribosylations of 6,7dimethylpterin (3) led with the halosugar $\mathbf{1 0}$ and $\mathrm{HgO} / \mathrm{HgBr}_{2}$ to $3-(2,3,5$-tri-O-benzoyl- $\beta$-D-ribofuranosyl)-6,7-dimethylpterin (13) in $14 \%$ yield whereas the use of $\mathbf{1 1}$ and $\mathrm{BF}_{3}$-catalysis formed the $\mathrm{N}_{1}$-riboside (20) in $14 \%$ as the main reaction product besides $8 \%$ of the $\mathrm{N}_{3}$-isomer (13). The ribosylation reaction have also been extended to 6-methylpterin (4) yielding with 11 and $\mathrm{BF}_{3}$ small amounts of the $\mathrm{N}_{1}-(21)$ and $\mathrm{N}_{3}$-riboside (14), with 7-methyl-pterin (5) the $\mathrm{N}_{3}-$ riboside ((15) in $6 \%$ yield and with 7-tert.butylpterin (8) again a mixture of $\mathrm{N}_{1^{-}}$(24) and $\mathrm{N}_{3}-$ riboside (18). A highly unpleasant reaction was encountered with pterin (1) itself which led after a tedious isolation and purification process only to $10 \%$ yield of the $1-(2,3,5$.tri-O-benzoyl- $\beta$-Dribofuranosyl)pterin (25). Debenzoylations of the sugar protecting groups can be achieved by the Zemplen ${ }^{30}$ method as demonstrated with 13, 19 and 20, respectively, forming the free pterinnucleosides 28-30.

The encountered difficulties during the ribosylations of the pterin derivatives, in general, force us to search for a more convenient synthetic pathway to this class of pteridine nucleosides. The more soluble 2-methylthio- $4(3 \mathrm{H}$ )pteridione (31) and its 6,7-dimethyl-(32) and 6,7-diphenyl(33) derivatives have been chosen as the most likely candidates due to the fact that the methylthio group can be displaced by amino functions nucleophilicly. The ribosylations of 31, 32 and 33 via their $O^{4}$-trimethylsilyl derivatives (34) with 11 and $\mathrm{BF}_{3}$ catalysis led in moderate to good yields in each case to a mixture of the corresponding $\mathrm{N}_{1}$-(35-37), and $\mathrm{N}_{3}$-ribosides (3840).

Treatment of the 2-methylthio-1-(2,3,5-tri-O-benzoyl- $\beta$-D-ribofuranosyl)-4(3H)-pteridones 35-37 with a great variety of amines led under displacement of the methylthio group and subsequent cleavage of the benzoyl groups by sodium methoxide to the corresponding pterin- $\mathrm{N}_{1-}$ ribofuranosides 41-51.

Similar treatment of 37 with dimethylamine afforded first 2-dimethylamino-6,7-diphenyl-1-(2,3,5-tri-O-benzoyl-ß-D-ribofuranosyl)-4(3H)-pteridone (51) but debenzoylation by the Zemplen method was not successful since sodium methoxide led to the cleavage of the glycosidic linkage forming 2-dimethylamino-6,7-diphenyl-4-(3H)-pteridone (66) (Fig. 1).

## Structural assignment

The site of attachment of the sugar moiety to the pterin nucleus can best be assigned by comparison of the UV spectra with those of the corresponding model substances 52-66 most of which are already described in literature. We have determined in several cases also the $\mathrm{pK}_{\mathrm{a}}$ values ${ }^{31}$ in order to compare the spectra of the cations and the neutral species as an additional structural proof (Tab. 1).

Table 2. UV-data of 2-methylthio-lumazine nucleosides and model substances

Table 3. UV-data of $\mathrm{N}^{2}$-substituted pterin nucleosides

The ${ }^{1} \mathrm{H}$-NMR spectra (experimental part) of the benzoyl protected ribonucleosides have not been very informative since overlapping signals make accurate assignments difficult. The free $\beta$ -D-ribofuranosylpterin nucleosides (28-30, 41-50) on the other hand showed well separated proton signals of the sugar moieties which are in good agreement with the pattern of the
ribonucleosides, in general. The $\mathrm{H}-\mathrm{C}\left(1^{\prime}\right)$ appears always as doublet at lowest field followed by the $5^{\prime}-\mathrm{OH}, 2^{\prime}-\mathrm{OH}, 3^{\prime} \mathrm{OH}, \mathrm{H}-\mathrm{C}\left(2^{\prime}\right), \mathrm{H}-\mathrm{C}\left(3^{\prime}\right), \mathrm{H}-\mathrm{C}\left(4^{\prime}\right)$ and $\mathrm{H}-\mathrm{C}\left(5^{\prime}\right)$ towards higher fields.

## Experimental Section

General Procedures. Products were dried under high vacuum. TLC: precoated cellulose thinlayer sheets F 1440b LS 254 and silica gel thin-layer sheets F 1500 LS 254 from Schleicher and Schüll. Preparative TLC: plates $20 \times 20 \times 0.2 \mathrm{~cm}$ with silica gel 60 PF 254 from Merck. Column chromatograhy (CC): silica gel 60, 70-230 mesh from Merck. Low pressure chromatography ${ }^{32}$ (LPC): LiChroprep Si 60 from Merck according to ${ }^{33}$ under 8-10 atm. Short column chromatography (SCC): silica gel 60 H from Merck. UV/VIS: Perkin-Elmer Lambda 5; $\quad \max$ in $\mathrm{nm}\left(\log (\quad) .{ }^{1} \mathrm{H}\right.$-NMR: Bruker AC 250 ; in $\mathrm{CDCl}_{3}$ or $\left(\left(\mathrm{D}_{6}\right) \mathrm{DMSO}\right)$, in ppm rel. to $\mathrm{SiMe}_{4}$ as internal standard. M.p.: Büchi apparatus, model Dr. Tottuli; no corrections. The $\mathrm{pK}_{\mathrm{a}}$ measurements were performed by the spectrophotometric method ${ }^{31}$. Products were dried under high vacuum.

2-Amino-3-(2,3,5-tri-O-benzoyl- $\beta$-D-ribofuranosyl)-6,7-diphenyl-4(3H)pteridinone (12), 2-Amino-1-(2,3,5-tri-O-benzoyl-ß-D-ribofuranosyl)-6,7-diphenyl-4(3H)pteridinone (19) and 2-Imino-1, $O^{4}$-bis-(2,3,5-tri-O-benzoyl-ß-D-ribofuranosyl)1,2-dihydropteridine (26).
A mixture of 6,7 -diphenylpterin (2) ${ }^{34}(0.945 \mathrm{~g}, 3 \mathrm{mmol})$ and $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{SO}_{4}(0.1 \mathrm{~g})$ was heated in hexamethyldisilazane (HMDS) $(15 \mathrm{ml}) 6$ days under reflux till a clear solution was obtained. The excess of HMDS was removed in vacuum and the resulting 9 dissolved in abs. benzene ( 15 ml ). A solution of 1-bromo-2,3,5-tri-O-benzoyl-D-ribofuranose (10) ${ }^{35}$ ( $1.575 \mathrm{~g}, 3 \mathrm{mmol}$ ) in benzene $(15 \mathrm{ml})$ and each 0.75 g of HgO and $\mathrm{HgBr}_{2}$ were added. The mixture was refluxed for 4 h , evaporated and the residue treated with $\mathrm{CHCl}_{3}(100 \mathrm{ml})$. The mercury salts were filtered off and the filtrate shaken with a KJ solution (15\%). The organic phase was tried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, evaporated to a smaller volume, put onto a silica gel column ( $7 \times 35 \mathrm{~cm}$ ) and first developed with $\mathrm{CHCl}_{3}$ (4 1). Evaporation of this fraction 1 gave a mixture of 3 nucleosides ( 1.26 g ). The solvents system was changed to $\mathrm{CHCl}_{3} / \mathrm{MeOH}(19: 1,11)$ followed by $(9: 1,11)$ and gave on evaporation fraction $2(0.15 \mathrm{~g})$. Fraction 3 resulted from the elution with $\left(\mathrm{CHCl}_{3} / \mathrm{MeOH} 4: 1(500 \mathrm{ml})\right.$ and $(1: 1,1.5 \mathrm{l})$ to give 0.3 g .
Fraction 1 was further separated by low pressure chromatography on a column type $\mathrm{C}^{30}$ ( $3 \times 50$ cm , silica gel Lichroprep Si 60 ) and a pressure of 10 atm . The eluents n-hexane/ $\mathrm{CHCl}_{3}(7 / 3)$ separated first unreacted sugar and with $6 / 4$ next $26(0.21 \mathrm{~g}, 9 \%)$ and followed by $12(0.675 \mathrm{~g}$, $30 \%$ ). Fraction 2 was separated by preparative thick-layer chromatography on plates ( $40 \times 20 \times$ 0.2 cm ) with $\mathrm{CHCl}_{3} / \mathrm{MeOH}$ (19:1). The main band was eluted with $\mathrm{CHCl}_{3} / \mathrm{MeOH}(9: 1)$ to give 12 ( $0.12 \mathrm{~g}, 15 \%$ ). Fraction 3 gave on chromatography on thick-layer plates with $\mathrm{CHCl}_{3} / \mathrm{MeOH}$ (9:1) 19 ( $0.165 \mathrm{~g}, 7 \%$ ).

## 2-Amino-1-(2,3,5-tri-O-benzoyl-ß-D-ribofuranosyl)-6,7-diphenyl-4(3H)pteridinone (19).

Silylation analogous to the preceding procedure with $2(1.265 \mathrm{~g}, 4 \mathrm{mmol})$. The intermediate 9 was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(30 \mathrm{ml})$, 1-O-acetyl-2,3,5-tri-O-benzoyl- $\beta$-D-ribofuranose (11) ${ }^{35}$ (2.01 $\mathrm{g}, 4.1 \mathrm{mmol}$ ) and $\mathrm{BF}_{3}$-etherate $(4 \mathrm{ml})$ were added and stirred at rt for 4 h . Dilution with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ $(50 \mathrm{ml})$, treatment with saturated $\mathrm{NaHCO}_{3}$ solution, drying of the organic layer with $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and evaporation to give a crude mixture ( 3.2 g ). Separation by $\mathrm{CC}\left(7 \mathrm{x} 30 \mathrm{~cm}\right.$ ) first with $\mathrm{CHCl}_{3}(1.5$ 1), then with $\mathrm{CHCl}_{3} / \mathrm{MeOH}(19: 1,500 \mathrm{ml} ; 13: 1,500 \mathrm{ml}$ and 9:1, 1.51$)$ to give the main fraction on evaporation. The mixture was further purified by chromatography on 10 thick-layer plates ( 40 x 20 x 0.2 cm ) with $\mathrm{CHCl}_{3} / \mathrm{MeOH}(19: 1)$. The main band was cut out, eluted with $\mathrm{CHCl}_{3} / \mathrm{MeOH}$ (12:1), evaporated to give 1.535 g of 19. Recrystallization from isopropanol/ $\mathrm{H}_{2} \mathrm{O}(1: 1,40 \mathrm{ml})$ gave $1.47 \mathrm{~g}(50 \%)$ of pure 19 of m.p. $152^{\circ}{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}\right): 8.00-7.20\left(\mathrm{~m}, 28 \mathrm{H}, \mathrm{NH}_{2}, 25\right.$ arom. 2-Amino-3-(2,3,5-tri-O-benzoyl-ß-D-ribofuranosyl)-6,7-dimethyl-4(3H)pteridinone (13) and 2-Amino-1-(2,3,5-tri-O-benzoyl-ß-D-ribofuranosyl)-6,7-dimethyl-4(3H)pteridinone (20). A mixture of 6,7-dimethylpterin (3) $(0.955 \mathrm{~g}, 5 \mathrm{mmo})$ and $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{SO}_{4}(0.1 \mathrm{~g})$ in hexamethyldisilazane ( 10 ml ) was heated under reflux for 5 h to form a clear solution. The excess of HMDS was distilled off, the residue dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(15 \mathrm{ml}), \mathbf{1 1}(2.52 \mathrm{~g}, 5.1 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(15 \mathrm{ml})$ and $\mathrm{BF}_{3}$-etherate ( 5 ml ) added. After stirring at rt for 4 h the reaction solution was treated with saturated aqueous $\mathrm{NaHCO}_{3}$ solution, the organic layer separated, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and evaporated to dryness. The residue was dissolved in $\mathrm{CHCl}_{3}$, put onto a silica gel column $(7 \times 30 \mathrm{~cm})$ and developed first with $\mathrm{CHCl}_{3}(1,51)$ to give unreacted sugar and followed by $\mathrm{CHCl}_{3} / \mathrm{MeOH}(19: 1,500 \mathrm{ml} ; 12: 1,1000 \mathrm{ml}$ and $9: 1,1000 \mathrm{ml}$ ) to give a mixture of 3 substances ( 1.1 g ). This fraction was separated on preparative silica gel plates ( $40 \times 20 \times 0.2 \mathrm{~cm}$ ) with $\mathrm{CHCl}_{3} / \mathrm{MeOH}(9: 1)$. The lower band ( $\mathrm{R}_{\mathrm{f}} 0.28$ ) was eluted with $\mathrm{CHCl}_{3} / \mathrm{MeOH}(9: 1)$ and gave on evaporation pure $20(0.425 \mathrm{~g}, 14 \%)$.
The upper band was still a mixture of two substances and had to be rechromatographed on plates with $\mathrm{CHCl}_{3} / \mathrm{MeOH}(19: 1)$ to get partial separation. The band $\left(\mathrm{R}_{\mathrm{f}} 0.51\right)$ gave after elution with $\mathrm{CHCl}_{3} / \mathrm{MeOH}(9: 1)$, evaporation and recrystallization from i- $\mathrm{PrOH} / \mathrm{H}_{2} \mathrm{O}(1: 1)$
13 ( $0.25 \mathrm{~g}, 8 \%$ ).

2-Amino-3-(2,3,5-tri-O-benzoyl-ß-D-ribofuranosyl)-6,7-dimethyl-4(3H)pteridinone (13).
Silylation of $3(0.955 \mathrm{~g}, 5 \mathrm{mmol})$ was performed analogous to the preceding procedure. The silylated intermediate $\mathbf{9}$ was dissolved in abs. $\mathrm{C}_{6} \mathrm{H}_{6}(35 \mathrm{ml})$, then $\mathbf{1 0}(2.27 \mathrm{~g}, 4.5 \mathrm{mmol}), \mathrm{HgO}$ $(1.25 \mathrm{~g})$ and $\mathrm{HgBr}_{2}(1.25 \mathrm{~g})$ added. The mixture was heated under reflux for 4 h . After cooling $\mathrm{MeOH}(2 \mathrm{ml})$ was added, the mixture evaporated to dryness, the residue dissolved in $\mathrm{CHCl}_{3}(50$ $\mathrm{ml})$ and then shaken several times with $15 \%$ aqueous KJ solution to remove the mercury salts. The organic layer was separated, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and again evaporated. The residue was dissolved in $\mathrm{CHCl}_{3}$, put onto a silica gel column ( $4.5 \times 45 \mathrm{~cm}$ ) and developed with $\mathrm{CHCl}_{3} / \mathrm{MeOH}$ (19:1). After 1.51 elution the next fraction $(400 \mathrm{ml})$ was collected, evaporated to give 0.6 g . This mixture was further purified on 5 preparative thick layer plates ( $40 \times 20 \times 0.2 \mathrm{~cm}$ ) with $\mathrm{CHCl}_{3}$, MeOH (19:1). The main band was cut out, eluted by $\mathrm{CHCl}_{3} / \mathrm{MeOH}(15: 1)$ to give after evaporation $13(0.425 \mathrm{~g}, 14 \%)$ of m.p. $168^{\circ} \mathrm{C}$ (decomp.). ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}\right): 8.06-7.92(\mathrm{~m}, 5 \mathrm{H}$, arom. 2-Amino-3-(2,3,5-tri-O-benzoyl-ß-D-ribofuranosyl)-6-methyl-4(3H)pteridinone (14) and 2-Amino-1-(2,3,5-tri-O-benzoyl-ß-D-ribofuranosyl)-6-methyl-4(3H)pteridinone (21). A mixture of 6-methylpterin (4) ${ }^{36}(0.709 \mathrm{~g}, 4 \mathrm{mmol})$ and $\left(\mathrm{NH}_{4}\right){ }_{2} \mathrm{SO}_{4}(0.1 \mathrm{~g})$ in HMDS $(30 \mathrm{ml})$ was refluxed for 24 h , then evaporate, the residue dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(40 \mathrm{ml}), \mathbf{1 1}(2.01 \mathrm{~g}, 4 \mathrm{mmol})$ and $\mathrm{BF}_{3}$-etherate $(4 \mathrm{ml})$ added and then stirred at rt for 4 h . The reaction solution was treated with saturated aqueous $\mathrm{NaHCO}_{3}$ solution, the organic phase separated and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and evaporated. The residue was dissolved in $\mathrm{CHCl}_{3}$, put onto a silica gel column ( $8 \times 30 \mathrm{~cm}$ ) and developed first with $\mathrm{CHCl}_{3}(21)$ to give unreacted sugar. Extended elution with $\mathrm{CHCl}_{3} / \mathrm{MeOH}(19: 1,2.5 \mathrm{l})$ and $\mathrm{CHCl}_{3} / \mathrm{MeOH}(14: 1,500 \mathrm{ml})$ gave on evaporation a mixture of 14 and $21(0.745 \mathrm{~g})$. Its difficult separation was performed on preparative thick-layer silica gel plates ( $40 \times 20 \times 0.2 \mathrm{~cm}$ ) by repeated development with $\mathrm{CHCl}_{3} / \mathrm{MeOH}(19: 1)$ to get separation of 2 main bands. Elution of the faster moving band yielded after evaporation $0.18 \mathrm{~g}(6 \%)$ of 14 and from the lower moving band $0.27 \mathrm{~g}(9 \%)$ of 21.

## 2-Dimethylamino-6,7-diphenyl-1-(2,3,5-tri-O-benzoyl- $\Omega-D-r i b o f u r a n o s y l)-4(3 H)-$

pteridinone (51). A solution of $37(0.158 \mathrm{~g}, 0.2 \mathrm{mmol})$ in abs. THF ( 5 ml ) was cooled to $-15^{\circ} \mathrm{C}$ and then methanolic dimethylamine $(115 \%, 2 \mathrm{ml})$ added. After storage in the icebox for 2 days was evaporated and the residue purified on a preparative silica gel plate with $\mathrm{CHCl}_{3} / \mathrm{MeOH}$ (19:1). The main band was eluted, evaporated and the residue recrystallized from $\mathrm{EtOH} / \mathrm{H}_{2} \mathrm{O}$ (1:1) to give $0.135 \mathrm{~g}(86 \%)$ of 51. M.p. $130^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}\right)$ : 7.93-7.22 (m, 25 H , arom. H ); 6.70 (d, 1 H, H-C(1')); 6.11 (dd, 1 H, H-C(2')); 5.83 (m, $1 \mathrm{H}, \mathrm{H}-\mathrm{C}\left(3^{\prime}\right)$ ); 4.64 (m, $\left.1 \mathrm{H}, \mathrm{H}-\mathrm{C}\left(4^{\prime}\right)\right)$; 4.25 (m, $2 \mathrm{H}, \mathrm{H} . \mathrm{C}\left(5^{\prime}\right)$ ); $4.10\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{N}\left(\mathrm{CH}_{3}\right)_{2}\right)$. Anal. Calc. for $\mathrm{C}_{46} \mathrm{H}_{37} \mathrm{~N}_{5} \mathrm{O}_{8}$ x $0.5 \mathrm{H}_{2} \mathrm{O}$ (796.8): C, 69.34; H, 4.81; N, 8.79. Found: C, 69.08; H, 5.03; N, 8.80.
1-Methyl-2-methylamino-6,7-diphenyl-4(3H)pteridinone (64). To a solution of ethanolic methylamine $(50 \%, 30 \mathrm{ml})$ was added 1-methyl-2-methyltio-6.7-diphenyl-4(3H)pteridone $(\mathbf{6 1})^{40}$ $(0.12 \mathrm{~g}, 0.33 \mathrm{mmol})$ and the mixture stirred for 1 h and then evaportated. The residue was purified by preparative thick layer chromatography on a silica gel plate ( $40 \times 20 \times 02 \mathrm{~cm}$ ) with $\mathrm{CHCl}_{3} / \mathrm{MeOH}(9: 1)$, The main band was eluted, evaporated and the solid recry-stallized from $\mathrm{EtOH} / \mathrm{H}_{2} \mathrm{O}$ to give $98 \mathrm{mg}(86 \%)$ of 65. M.p. $299^{\circ} \mathrm{C}$. Anal. Calc. for $\mathrm{C}_{20} \mathrm{H}_{17} \mathrm{~N}_{5} \mathrm{O} \times \mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}$ (389.4): C, 67.85; H, 5.85; N, 17.98. Found: C, 67.67; H, 5.56; N, 18.28.

1-Methyl-2-dimethylamino-6,7-diphenyl-4(3H)pteridinone (65). Analogous to the preceding procedure with $61(0.12 \mathrm{~g}, 0.33 \mathrm{mmol})$ in methanolic dimethylamine solution ( 20 ml ) and stirring for 1 day. Work-up and recrystallization from $\mathrm{EtOH} / \mathrm{H}_{2} \mathrm{O}$ gave $57 \mathrm{mg}(71 \%)$ of 66. M.p. $229^{\circ}$ C. Anal. Calc. for $\mathrm{C}_{21} \mathrm{H}_{19} \mathrm{~N}_{5} \mathrm{O}$ (357.4): C, 70.57 ; H, 5.36 ; N, 19.59. Found: C, 70.43; H, 5.29; N, 19.34.
