#### Abstract

This study provides expedient methods for the synthesis of some novel fused heteropolycycles. Thus, a variety of fused di-, tri- and tetracyclic nitrogen and nitrogen-sulfur heteropolycycles $\mathbf{8}$, 9, 11-15 were smoothly synthesized by Friedel-Crafts intramolecular alkylations of heteroarylalkanols 1-7 in the presence of both Brönsted (PPA and PTSA) and Lewis $\left(\mathrm{AlCl}_{3} / \mathrm{CH}_{3} \mathrm{NO}_{2}\right)$ acid catalysts. The precursor alkanols were readily prepared by reaction of the corresponding carboxylic acid esters with methylmagnesium iodide. The structures of the compounds are established using both spectral and analytical data. A plausible carbocation mechanism is proposed to account for the results.

Keywords: Friedel-Crafts cyclialkylation, heteropolycycles, 4,4-dimethyl-5,6-dihydro-4H-pyrido[3,2,1-jk]carbazole, 3,3-dimethyl-2,3-dihydro-1H-benzo[ kl$]$ acridine, 5,5-dimethyl-2-phenyl-4,5-dihydrocyclopenta[de]quinoline, 3,3-dimethyl-2,3-dihydro-1H-pyrido[3,2,1$k l]$ phenothiazine

## Introduction

A variety of methods have been developed for the synthesis of biologically and pharmacologically active heteropolycycles that bear quinoline or tetrahydroquinoline fragments. ${ }^{1,2}$ Among these methods, intramolecular Friedel-Crafts reactions (called cyclialkylations $)^{3}$ prompted by both Brönsted and Lewis acid catalysts proved to introduce powerful pathways for the facile construction of not only homo- but also heteropolycycles. ${ }^{4,5}$

In this paper, we introduce the construction of seven nitrogen and nitrogen-sulfur polycycles 8, 9, 11-15 containing fused quinoline, tetrahydroquinoline, acridine, phenothiazine and indole moieties via Friedel-Crafts cyclialkylations of seven new heteroarylalkanols 1-7 (Scheme 1). ${ }^{\dagger}$ For preceding paper of the series see ref 19. ## Results and Discussion

Synthesis and cyclialkylation of 4-(9H-carbazol-9-yl)-2-methylbutan-2-ol (1). This hitherto unknown 4-(9H-carbazol-9-yl)-2-methylbutan-2-ol 1 was synthesized in two consecutive steps starting from 3-(9H-carbazol-9-yl)propanoic acid ${ }^{6}$ by conversion to ethyl ester followed by reaction with methylmagnesium iodide.

Cyclialkylation of alcohol 1 in the presence of both polyphosphoric acid (PPA) and ptoluenesulfonic acid (PTSA) catalysts gave 4,4-dimethyl-5,6-dihydro-4H-pyrido[3,2,1$j k]$ carbazole $\mathbf{8}$ as sole product. The results are presented in Scheme 2 and Table 1 (Entries 1 and 2).

## Synthesis and cyclialkylation of 4-(acridin-9-yl)-2-methylbutan-2-ol (2)

The title alcohol was synthesized by addition of methymagnesium iodide to methyl 3-(acridin-9yl)propanoate. ${ }^{7}$ Cyclialkylation of carbinol 2 was carried out using PPA and $\mathrm{AlCl}_{3} / \mathrm{CH}_{3} \mathrm{NO}_{2}$ catalysts in methylene chloride solvent. The product from PPA was shown to be pure 3,3-dimethyl-2,3-dihydro- $1 H$-benzo[ $k l$ ]acridine 9. With $\mathrm{AlCl}_{3} / \mathrm{CH}_{3} \mathrm{NO}_{2}$ for 2 hours, however, the
product was shown to be a mixture of tetracyclic product 9 (60\%) and 9-(3-methylbut-2-en-1yl)acridine 10 (35\%) (Scheme 3; Table 1, Entries 3 and 4)

## Synthesis and cyclialkylation of 2-methyl-4-(10H-phenothiazin-10-yl)butan-2-ol (3)

Alkanol 3 was synthesized by treatment of ethyl 3-(10H-phenothiazin-10-yl)propanoate ${ }^{8}$ with methylmagnesium iodide in dry ether. Cyclialkylation of $\mathbf{3}$ in the presence of PPA and PTSA catalysts gave 3,3-dimethyl-2,3-dihydro- $1 H$-pyrido[3,2,1-kl] phenothiazine $\mathbf{1 1}$ as a sole product (Scheme 4; Table 1, Entries 5 and 6).

Cyclialkylation of carbinol 4 was carried out in the presence of PPA, $\mathrm{H}_{3} \mathrm{PO}_{4}$ and PTSA catalysts. The products of reactions with all three catalysts were identical and were shown to be

4,4-dimethyl-5,6,8,9,10,11-hexahydro-4H-pyrido[3,2,1-jk]carbazole 12 (Scheme 5; Table 1, Entries 7-9).

This alcohol was obtained by addition of two equivalents of methylmagnesium iodide to ethyl 3(diphenylamino) propanoate. ${ }^{11}$

The cyclialkylation of alcohol 6 was carried out in the presence of both PPA and PTSA catalysts under different reaction conditions. The products with both catalysts were identical and were shown to be 4,4-dimethyl-1-phenyl-1,2,3,4-tetrahydroquinoline $\mathbf{1 4}$ (Scheme 7; Table 1, Entries 12 and 13).

Cyclialkylation of alkanol 7 in the presence of either PPA or PTSA catalyst gave 6,6-dimethyl-2-phenyl-5,6-dihydro-4H-pyrrolo[3,2,1-ij]quinoline 15 as a sole product (Scheme 8; Table 1, Entries 14 and 15).

## Conclusions

In conclusion, we have developed a facile and efficient approach to synthesize seven new heteropolycycles 8, 9, 11-15 via intramolecular Friedel-Crafts cyclialkylations of seven new heteroarylalkanols 1-7. All together, the results of this study proved that Friedel-Crafts cyclialkylation can be considered as one of the most useful pathways to the synthesis of di-, triand higher condensed polycycles enclosing one or more heteroatoms.

## Experimental Section

General. Melting points were measured on a digital Gallenkamp capillary melting point apparatus and are uncorrected. Infrared spectra were determined with a Shimadzu 470 Infrared spectrophotometer using KBr wafer and thin film techniques $\left(\nu \mathrm{cm}^{-1}\right)$. ${ }^{1} \mathrm{H}$ NMR spectra were recorded by 90 MHz Varian NMR spectrometer using the appropriate deuteriated solvent with TMS as internal standard. Chemical shifts ( $\delta$ ) and $J$ values are reported in ppm and Hz , respectively. Elemental analyses were performed on a Perkin-Elmer 2400 Series II analyzer. The mass spectra were performed by JEOL JMS 600 spectrometer at an ionizing potential of 70 eV using the direct inlet system. Reactions were monitored by thin layer chromatography (TLC) using precoated silica plates (Kieselgel 60, F 254, E. Merck) visualized with UV light. Flash column chromatography (FC) was performed on silica gel (230-400 mesh, E. Merck). All reagents were purchased from Merck, Sigma or Aldrich Chemical Co. and were used without further purification.
