Dedicated with respect to Professor Siegfried Blechert on the occasion of his 65th birthday

Abstract
The partially-protected D-lyxose derivative 4 was converted into the thioether-substituted lactol 6, which was subjected to Ohira–Bestmann alkynylation, O-allylation and ene–yne metathesis to give a bicyclic vinyloxepin. This underwent high-yielding and completely regio-and stereo Diels–Alder dimerisation at ambient temperature. X-Ray crystallographic analysis of the dimer revealed unexpectedly that epimerisation at the sugar C2-position had taken place during the alkynylation step.

Keywords: Diels–Alder dimerisation, ene–yne metathesis, epimerisation, Ohira–Bestmann reaction, vinyloxepin

Introduction
Since it was first reported 25 years ago, ring-closing ene–yne metathesis1 has been developed as an atom-economical way of forming 1,3-diene moieties incorporated in carbo- and heterocyclic systems, which have been further shown to participate in Diels–Alder reactions.2

We became interested in utilising the ene–yne metathesis reaction of the sugar-derived substrate 1 to assemble vinyloxepin 2, with the intention of subjecting it to elimination to give trienol 3 (Scheme 1), which was required for intramolecular hetero-Diels–Alder reactivity studies in conjunction with imine dienophiles. This paper presents the results of these studies.
**Results and Discussion**

Our synthesis approach began with 2,3-di-O-isopropylidene-D-lyxofuranose 4, which was converted into the bis(thioether) 5 under standard conditions. Selective hydrolysis of the anomeric carbon–sulfur bond gave the bicyclic lactol 6, which was exposed to the Ohira–Bestmann reagent 5 under basic conditions with the intention of obtaining the homologated, monocyclic terminal alkyne 7; subsequent O-allylation would provide the ether substrate for ene–yne metathesis studies. In the event, esterification of the product of Ohira–Bestmann reaction of 6 gave a 3,5-dinitrobenzoate which was shown by X-ray crystallography to be 10, which was epimeric at the propargylic stereocentre (Figure 1). Since the structure of the thioglycoside 5 had already been confirmed by X-ray crystallography, the epimerisation must have occurred during the Ohira–Bestmann homologation, giving 8 instead of 7; such unwanted base–acid reactivity has been documented previously (Scheme 2). Compound 8 was allylated under standard conditions to give ether 9 in nearly quantitative yield.

In initial experiments, ether 9 was exposed to Grubbs’ second-generation catalyst (5 mol %) in dichloromethane (0.05 M) at room temperature for 48 h. Compound 13, the product of cross-metathesis of the expected vinyloxepin 11 was isolated in 13% yield, together with 21% of unreacted 9. In an effort to increase the turnover rate of the catalyst, an analogous reaction was conducted under an atmosphere of ethylene; this gave in 70% yield the vinyloxepin 11 and the ethylene–alkyne cross-metathesis product 12 as an inseparable 4:3 mixture (Scheme 3). Similar reactivity in the presence of ethylene has been reported by Mori and co-workers. In further experiments, ether 9 was treated with 10 mol % Grubbs’ second-generation catalyst in dichloromethane (0.05 M) under reflux conditions for 3.5 h, giving 11 in 42% yield. However, the product readily decomposed at higher concentrations and elevated temperatures, and as a consequence could be stored only as a dilute solution in dichloromethane for short periods. The decomposition product was determined to be a dimer, the product of a highly stereo- and regioselective Diels–Alder reaction of vinyloxepin 11 with itself. X-ray crystallography confirmed the regiochemistry of the cycloadduct 14 (Figure 2). Dimerisation of 7-membered
vinyl oxepins via thermal or Lewis acid-catalysed Diels–Alder reaction has previously been reported.\textsuperscript{12}

Summary

In summary, the results described herein demonstrate the susceptibility to epimerisation of acetonide-protected sugar lactols under the basic conditions of the Ohira–Bestmann reaction. The facile Diels-Alder dimerisation of diene 11 is unusual; ongoing studies are directed towards the identification of alternative, non-basic reaction sequences for the synthesis of 7, and its subsequent allylation and ene–yne metathesis reactions.

Experimental Section

General. Standard laboratory techniques were employed when handling air-sensitive reagents. All reactions were performed under a nitrogen atmosphere unless otherwise stated. Melting points were determined using a Stuart Scientific SMP1 or Büchi B-545 melting point apparatus and are uncorrected. Optical rotations were measured on an Optical Activity Ltd, AA-10 Automatic or polAAr 3000 Automatic polarimeter. Infrared spectra were recorded on Perkin–Elmer Spectrum RX FT-IR or Spectrum One FT-IR spectrometers. All $^1$H and $^{13}$C NMR spectra were recorded on a Bruker Ultra-Shield AV-400 spectrometer. Chemical shifts (δH and δC) are

Figure 2. The molecular structure of cycloadduct 14.
expressed in parts per million (ppm), referenced to the appropriate residual solvent peak. Mass spectra (CI, EI and FAB) were recorded using a Micromass AutoSpec-Q, Micromass Platform II or Micromass AutoSpec Premier spectrometer. Elemental analyses were performed at the microanalytical laboratories of the London Metropolitan University. Thin-layer chromatography was performed on aluminium plates pre-coated with silica gel (0.2 mm, Merck Kieselgel 60 F_{254}), which were developed using standard visualising agents: ultraviolet fluorescence (254 nm) and/or potassium permanganate and vanillin. Flash column chromatography was performed using BDH (40–63 µm) flash chromatography silica gel unless otherwise stated. Standard solvents were distilled under nitrogen prior to use: THF was distilled from sodium-benzophenone ketyl and CH$_2$Cl$_2$, MeOH and pyridine from CaH$_2$. Hexane refers to the fraction of petroleum boiling between 67–70 °C. All other solvents and reagents were used as received from the supplier unless otherwise noted.

**Phenyl 2,3-O-isopropylidene-5-S-phenyl-1,5-dithio-β-D-lyxofuranoside (5).** To a stirred suspension of D-(−)-lyxose (1.00 g, 6.66 mmol, 1.0 equiv) in acetone (25 mL) was added concentrated H$_2$SO$_4$ (60.4 µL, 1.13 mmol, 0.17 equiv). The reaction mixture was stirred at room temperature for 15 h. Then, neutralised by the addition of Na$_2$CO$_3$ (2.5 g). After stirring for 3 h at room temperature, the mixture was filtered and concentrated under reduced pressure to give crude 2,3-O-isopropylidene-D-lyxofuranose 4 (1.34 g) as a colourless gum, which was dissolved in dry pyridine (5.6 mL) along with diphenyl disulfide (3.64 g, 16.7 mmol, 2.5 equiv). To this stirred yellow solution at room temperature was added tri-n-butylphosphine (6.67 mL, 26.7 mmol, 4.0 equiv) dropwise. During the addition an exotherm was observed and at the end of addition a dark red solution was observed. After 17 h at room temperature, the reaction mixture was quenched with CH$_2$Cl$_2$ (50 mL). After 15 min, a pale yellow solution was observed, which was washed with saturated aqueous NaHCO$_3$ solution (50 mL) and water (50 mL). The combined aqueous layers were extracted with CH$_2$Cl$_2$ (4 x 20 mL). The combined organic layers were dried (Na$_2$SO$_4$) and concentrated under reduced pressure to give a green residue. Purification by chromatography (0→5% Et$_2$O–hexane) gave phenyl 2,3-O-isopropylidene-5-S-phenyl-1,5-dithio-β-D-lyxofuranoside 5 (1.63 g, 65% over 2 steps) as colourless needles; mp 77.0 – 79.0 °C (Et$_2$O); R$_f$ 0.27 (20% Et$_2$O–hexane); [α]$_D^{25}$ −88.5 (c 1.04, CHCl$_3$); $\nu_{\text{max}}$ (film) 3058 (Ar-H, w), 2988 (CH$_3$, m), 2938 (CH$_2$, m), 2869 (CH$_2$, w), 1584 (C=C, m), 1482 (CH$_2$, s), 1440 (CH$_3$, m), 1382 (CH$_3$, m), 1373 (CH$_3$, m), 1270 (CH$_2$, m), 1228 (CH$_2$, m), 1209 (C-O, s), 1160 (C-O, m), 1100 (C-O, vs), 1062 (C-O, s), 1024 (C-O, vs), 976 (CH$_2$, m), 872 (Ar-H, m), 741 (Ar-H, vs), 692 (Ar-H, vs) cm$^{-1}$; $\delta$H (CDCl$_3$, 400 MHz) 7.52 (2H, d, J 7.0 Hz, ortho PhS), 7.44 (2H, d, J 8.0 Hz, ortho PhS), 7.34–7.21 (6H, m, meta PhS & para PhS), 4.92–4.89 (2H, m, H-1 & H-2), 4.79 (1H, dd, J 4.5 & 4.0 Hz, H-3), 3.75 (1H, ddd, J 7.5, 6.5 & 3.5 Hz, H-4), 3.40–3.38 (2H, m, H-5), 1.60 (3H, s, C(CH$_3$)$_2$), 1.40 (3H, s, C(CH$_3$)$_2$); $\delta$C (CDCl$_3$, 101 MHz) 135.7 (ipso PhS), 135.5 (ipso PhS), 130.5 (ortho PhS), 129.6 (ortho PhS), 129.0 (meta PhS), 128.9 (meta PhS), 126.9 (para PhS), 126.4 (para PhS), 113.3 (C(CH$_3$)$_2$), 89.8 (C-1), 82.3 (C-2), 80.3 (C-4), 80.0 (C-3), 31.2 (C-5), 26.0 (C(CH$_3$)$_2$), 25.2 (C(CH$_3$)$_2$); $m/z$ (CI) 392 ([M+NH$_4$]$^+$, 93%), 375 ([MH]$^+$,
100%), 263 ([M–SPh]+, 52%) (Found: [MH]⁺, 375.1077. C₂₀H₂₅O₃S₂ requires [MH]⁺, 375.1089) (Found: C, 64.23; H, 6.00%. C₂₀H₂₂O₃S₂ requires C, 64.14; H, 5.92%).

2,3-O-Isopropylidene-5-S-phenyl-5-thio-D-lyxofuranose (6). To a stirred solution of phenyl 2,3-O-isopropylidene-5-S-phenyl-1,5-dithio-β-D-lyxofuranoside 5 (100 mg, 0.267 mmol, 1.0 equiv) in MeCN/water (1.9 mL, 10:1) at room temperature was added 1,5-dithio-β-D-lyxofuranoside 6 (100 mg, 0.354 mmol, 1.0 equiv) in dry MeOH (0.93 mL) heated under reflux, was added a solution of dimethyl 1-diazo-2-oxopropylphosphonate (204 mg, 1.06 mmol, 3.0 equiv) in dry MeOH (0.74 mL) dropwise over a period of 8 h. The reaction mixture was stirred at room temperature for 45 h. The reaction mixture was filtered through a pad of celite, washing with CH₂Cl₂ (3 x 5 mL). The combined filtrate and washings were washed with 20% aqueous KI solution (10 mL), saturated aqueous NaHCO₃ solution (10 mL), dried (Na₂SO₄) and concentrated under reduced pressure to give a colourless semi-solid. Purification by chromatography (0→20% EtOAc–hexane) gave 2,3-O-isopropylidene-5-S-phenyl-5-thio-D-lyxofuranose 6 (64.2 mg, 85%, 93:7 dr) as a colourless oil; R_f 0.48 (50% EtOAc–hexane); [α]D²⁶ +33.9 (c 1.89, CHCl₃); νmax (neat) 3426 (O–H, br m), 3057 (Ar–H, w), 2987 (CH₃, m), 2939 (CH₂, m), 1584 (C=C, m), 1481 (CH₂, m), 1439 (CH₃, m), 1373 (CH₃, s), 1271 (CH₂, m), 1234 (CH₂, m), 1210 (C–O, s), 1161 (C–O, m), 1125 (C–O, m), 1066 (C–O, vs), 1025 (C–O, s), 1012 (C–O, s), 979 (CH₂, m), 866 (Ar–H, s), 739 (Ar–H, s), 691 (Ar–H, s) cm⁻¹; δH (CDCl₃, 400 MHz) 7.42 (2H, d, J 7.0 Hz, ortho PhS), 7.31 (2H, dd app. t, J 7.5 Hz, meta PhS), 7.22 (1H, t, J 7.5 Hz, para PhS), 5.41 (1H, d, J 6.0 Hz, H-1 major anomer), 4.98 (1H, dd, J 12.0 & 3.5 Hz, H-1 minor anomer), 4.80 (1H, dd, J 6.0 & 3.5 Hz, H-3 major anomer), 4.76 (1H, dd, J 6.0 & 3.5 Hz, H-3 minor anomer), 4.63 (1H, d, J 6.0 Hz, H-2 major anomer), 4.52 (1H, dd, J 6.0 & 3.5 Hz, H-2 minor anomer), 4.33 (1H, ddd app. td, J 7.0 & 3.5 Hz, H-4, major anomer), 3.91 (1H, d, J 12.0 Hz, OH minor anomer), 3.67 (1H, ddd, J 9.0, 6.0 & 3.0 Hz, H-4 minor anomer), 3.27 (1H, dd, J 13.5 & 7.0 Hz, H-5), 3.24 (1H, dd, J 13.5 & 7.0 Hz, H-5), 2.39 (1H, d, J 2.5 Hz, OH major anomer), 1.56 (3H, s, C(CH₃)₂ minor anomer), 1.50 (3H, s, C(CH₃)₂ major anomer), 1.40 (3H, s, C(CH₃)₂ minor anomer), 1.35 (3H, s, C(CH₃)₂ major anomer); δC (CDCl₃, 101 MHz) 135.8 (ipso PhS), 129.5 (ortho PhS), 128.9 (meta PhS), 126.3 (para PhS), 112.7 (C(CH₃)₂), 101.2 (C-1), 85.5 (C-2), 79.9 (C-3), 78.9 (C-4), 32.1 (C-5), 26.1 (C(CH₃)₂), 24.9 (C(CH₃)₂); m/z (CI) 300 ([M+NH₄]⁺, 61%), 283 ([MH]⁺, 100%), 265 ([M–OH]⁺, 96%) (Found: [MH]⁺, 283.1003. C₁₄H₁₉O₄S requires [MH]⁺, 283.1004) (Found: C, 59.62; H, 6.60%. C₁₄H₁₉O₄S requires C, 59.55; H, 6.43%).

(3S,4S,5S)-3,4-Isopropylidenediroyhex-1-yne-5-ol-6-thiobenzene (8). To a stirred suspension of 2,3-O-isopropylidene-5-S-phenyl-5-thio-D-lyxofuranose 6 (100 mg, 0.354 mmol, 1.0 equiv) and potassium carbonate (147 mg, 1.06 mmol, 3.0 equiv) in dry MeOH (0.93 mL) heated under reflux, was added a solution of dimethyl 1-diazo-2-oxopropylphosphonate (204 mg, 1.06 mmol, 3.0 equiv) in dry MeOH (0.74 mL) dropwise over a period of 8 h via a syringe pump. The reaction mixture was filtered through a glass frit to remove the residual inorganics. The filtrate was concentrated under reduced pressure to give a brown residue, which was dissolved in water (5 mL) and then extracted with EtOAc (3 x 5 mL). The combined organic extracts were concentrated under reduced pressure to give a yellow oil. Purification by chromatography (0→10% Et₂O–hexane) gave (3S,4S,5S)-3,4-isopropylidenediroyhex-1-yne-5-ol-6-thiobenzene
8 (61 mg, 62%) as a colourless oil; Rf 0.37 (50% Et2O–hexane); [α]D26 –33.3 (c 0.72, CHCl3); νmax (neat) 3479 (O–H, br m), 3289 (≡CH, m), 3059 (Ar–H, w), 2989 (CH3, m), 2935 (CH2, m), 2122 (C=C, w), 1584 (C=C, m), 1482 (CH2, m), 1440 (CH3, m), 1383 (CH3, s), 1247 (CH2, s), 1213 (C–O, s), 1158 (C–O, m), 1111 (C–O, m), 1059 (C–O, vs), 1026 (C–O, s), 879 (Ar–H, m), 741 (Ar–H, s), 691 (Ar–H, s) cm⁻¹; δH (CDCl3, 400 MHz) 7.43 (2H, d, J 7.0 Hz, ortho PhS), 7.32 (2H, dd app. t, J 7.5 Hz, meta PhS), 7.24 (1H, tt, J 7.5 & 1.0 Hz, para PhS), 4.62 (1H, dd, J 7.5 & 2.0 Hz, H-3), 4.26 (1H, dd, J 7.5 & 3.0 Hz, H-4), 3.76 (1H, dd, J 14.0, 7.0 & 3.0 Hz, H-5), 3.16 (1H, dd app. d, J 7.0 Hz, H-6), 3.13 (1H, dd app. d, J 6.5 Hz, H-6), 2.56 (1H, d, J 2.0 Hz, H-1), 2.50 (1H, br d, J 7.5 Hz, OH), 1.49 (3H, s, C(CH3)2), 1.45 (3H, s, C(CH3)2); δC (CDCl3, 101 MHz) 134.9 (ipso PhS), 130.3 (ortho PhS), 129.1 (meta PhS), 126.8 (para PhS), 111.0 (C(CH3)2), 82.2 (C-4), 80.5 (C-2), 75.1 (C-1), 68.1 (C-5), 66.7 (C-3), 38.2 (C-6), 26.6 (C(CH3)2), 26.0 (C(CH3)2); m/z (CI) 574 (2[M+NH4]⁺, 2%), 296 ([M+NH4]⁺, 43%), 279 ([MH]⁺, 57%), 263 ([M–CH3]⁺, 15%), 221 ([M–OC(CH3)2+H]⁺, 100%) (Found: [MH]⁺, 279.1048. C15H19O2S requires [MH]⁺, 279.1055) (Found: C, 64.84; H, 6.65%. C13H18O3S requires C, 64.72; H, 6.52%).

(3S,4R,5S)-3,4-Isopropylidenediacyclo-5-allyloxy-hex-1-yn-6-thiobenzene (9). To a stirred suspension of sodium hydride (511 mg, 12.8 mmol, 1.5 equiv, 60% dispersion in mineral oil) in dry DMF (21 mL) at 0 °C, was added a solution of diacyclo-5-allyloxy-hex-1-yn-5-ol-6-thiobenzene 8 (2.37 g, 8.51 mmol, 1.0 equiv) and allyl bromide (1.11 mL, 12.8 mmol, 1.5 equiv) in dry DMF (21 mL). Effervescence observed during addition. Then the reaction mixture was warmed to room temperature. After 60 min, at room temperature the reaction mixture was quenched with MeOH (5 mL). Concentrated under reduced pressure to give a pale yellow semi-solid residue, which was dissolves in CHCl3 (100 mL) and washed with saturated aqueous NaHCO3 solution (100 mL). Aqueous layer was extracted with CHCl3 (3 x 75 mL). The combined organic layers were dried (Na2SO4) and concentrated under reduced pressure to give a pale yellow oil. Purification by chromatography (0→5% Et2O–hexane) gave (3S,4R,5S)-3,4-isopropylidenediacyclo-5-allyloxy-hex-1-yn-6-thiobenzene 9 (2.66 g, 98%) as a colourless oil; Rf 0.62 (50% Et2O–hexane); [α]D24 –42.9 (c 1.12, CHCl3); νmax (neat) 3287 (≡CH, w), 3078 (Ar–H, w), 2988 (CH3, w), 2935 (CH2, w), 2119 (C=C, w), 1584 (C=C, w), 1481 (CH2, w), 1459 (CH3, w), 1382 (CH3, m), 1373 (CH3, m), 1246 (CH2, m), 1212 (C–O, m), 1157 (C–O, m), 1121 (C–O, m), 1060 (C–O, vs), 1025 (C–O, m), 990 (=CH–m), 924 (=CH2, m), 866 (Ar–H, m), 739 (Ar–H, s), 690 (Ar–H, s) cm⁻¹; δH (CDCl3, 400 MHz) 7.42 (2H, d, J 8.0 & 1.5 Hz, ortho PhS), 7.32 (2H, ddd app. t, J 8.0 Hz, meta PhS), 7.22 (1H, tt, J 7.5 & 1.0 Hz, para PhS), 5.88 (1H, ddd app. ddt, J 17.0, 10.5 & 6.0 Hz, H=H2C=C), 5.21 (1H, ddd app. dq, J 17.0 & 1.5 Hz, trans HC=CH2), 5.17 (1H, ddd app. dq, J 10.5 & 1.5 Hz, cis HC=CH2), 4.59 (1H, dd, J 7.5 & 2.0 Hz, H-3), 4.35 (1H, dd, J 7.5 & 3.5 Hz, H-4), 4.19 (1H, ddt, J 12.5, 5.5 & 1.5 Hz, CH2CH=CH2), 4.03 (1H, ddt, J 12.5, 6.0 & 1.5 Hz, CH2CH=CH2), 3.59 (1H, ddd app. td, J 6.5 & 3.5 Hz, H-5), 3.21 (1H, dd, J 13.5 & 6.5 Hz, H-6), 3.17 (1H, dd, J 13.5 & 6.5 Hz, H-6), 2.55 (1H, d, J 2.0 Hz, H-1), 1.47 (3H, s, C(CH3)2), 1.45 (3H, s, C(CH3)2); δC (CDCl3, 101 MHz) 135.9 (ipso PhS), 134.2 (HC=CH2), 129.8 (ortho PhS), 129.0 (meta PhS), 126.4 (para PhS), 117.8 (HC=CH2), 110.7 (C(CH3)2), 81.9
(C-4), 80.8 (C-2), 75.7 (C-5), 74.9 (C-1), 72.1 (CH₂CH=CH₂), 66.3 (C-3), 34.5 (C-6), 26.6 (C(CH₃)₂), 26.0 (C(CH₃)₂); m/z (CI) 336 ([M+NH₄]+, 33%), 319 ([MH]+, 6%), 303 ([M–CH₃]+, 4%), 261 ([M–OCH₂CH=CH₂]+, 100%) (Found: [M+NH₄]+, 336.1635. C₁₄H₂₅NO₃S requires [M+NH₄]⁺, 336.1633) (Found: C, 68.00; H, 6.87%. C₁₈H₂₂O₃S requires C, 67.89; H, 6.96%).

(S)-1-((4R,5S)-5-ethyl-2,2-dimethyl-1,3-dioxolan-4-yl)-2-(phenylthio)ethyl 3,5-dinitrobenzoate (10). To a stirred colourless solution of (3S,4S,5S)-3,4-isopropylidenedioxo-hex-1-ylene-5-ol-6-thiobenzene 8 (47 mg, 0.169 mmol, 1.0 equiv) in dry THF (0.66 mL) at 0 °C was added triethylamine (35.4 µL, 0.253 mmol, 1.5 equiv), followed by 3,5-dinitrobenzoyl chloride (42.8 mg, 0.186 mmol, 1.1 equiv). Solution turned yellow in colour on addition of the 3,5-triethylamine (35.4 µL, 0.253 mmol, 1.5 equiv), followed by 3,5-dinitrobenzoyl chloride (42.8 mg, 0.186 mmol, 1.1 equiv). Solution turned yellow in colour on addition of the 3,5-dinitrobenzoyl chloride. Reaction mixture was allowed to warm to room temperature. After 3 h at room temperature, the reaction mixture was partitioned between Et₂O (2 mL) and water (2 mL). The layers were separated and the aqueous layer was extracted with Et₂O (2 mL). The combined organic layers were washed with brine (2 mL), dried (Na₂SO₄) and concentrated under reduced pressure to give a yellow semi-solid. Purification by chromatography (0→5% Et₂O–hexane) gave (S)-1-((4R,5S)-5-ethyl-2,2-dimethyl-1,3-dioxolan-4-yl)-2-(phenylthio)ethyl 3,5-dinitrobenzoate 10 (53.8 mg, 67%) pale yellow fine needles; R₉ 0.46 (50% Et₂O–hexane); [α]D¹玖
