#### Abstract

New tri- and tetra-substituted $N$-arylpyrroles were synthesized by one-pot reaction of 3,7disubstituted quinazolinonium bromides with substituted alkynes having at least one electronwithdrawing substituent in 1,2-epoxybutane acting both as solvent and hydrogen bromide scavenger. Structural characterization of the new compounds was based on IR and NMR spectroscopy as well as on single crystal X-ray analysis.

Keywords: $N$-Arylpyrrole, 3,7-disubstituted quinazolinium $N 1$-bromides, 1,3-dipolar cycloaddition reaction

## Introduction

Tri- and tetra-substituted pyrroles are known to possess a broad range of biological activity that includes antimycobacterial action, inhibition of both neuronal and inducible nitric oxide synthases (nNOS and iNOS respectively), antifungal activity, and inhibition of oxidosqualene cyclase (OSC). ${ }^{1}$ For this reason, efforts are constantly being directed towards finding new synthetic pathways or improving known synthetic strategies. ${ }^{2}$

Our interest in obtaining new $N$-bridgehead heterocycles by the 1,3-dipolar cycloaddition reaction of the heteroaromatic $N$-ylides ${ }^{3}$ led us to investigate the reaction between quinazolinonium N1-ylides and acetylenic dipolarophiles with the aim of obtaining pyrrolo[1,2a]quinazoline derivatives. Surprisingly, instead of the expected pyrrolo[1,2-a]quinazolines, highly substituted pyrroles were obtained in moderate to good yields. ${ }^{4}$ The new tri- and tetrasubstituted pyrroles were obtained starting only from unsubstituted $4(3 \mathrm{H})$-quinazolinone and thus the possibility of extending the reaction to substituted $4(3 H)$-quinazolinones was considered.

Herein we present the one-pot synthesis of new tri- and tetra-substituted pyrroles starting from 7-chloro-4( $3 H$ )-quinazolinone with different acetylenic dipolarophiles, which afford structural variety to the new series of compounds.

## Results and Discussion

The new substituted pyrroles were synthesized starting from quinazolinonium $N 1$ bromides $\mathbf{3}$, which were obtained in good yields by the reaction of 3-methyl-7-chloro-4(3H)-quinazolinone 1 with 2-bromoacetophenones 2 according to Scheme 1.

Ar: a: $\mathrm{C}_{6} \mathrm{H}_{5} ; \mathbf{b}: 3-\mathrm{NO}_{2} \mathrm{C}_{6} \mathrm{H}_{4}: \mathbf{c}: 4-\mathrm{ClC}_{6} \mathrm{H}_{4} ; \mathbf{d}: 4-\mathrm{BrC}_{6} \mathrm{H}_{4} ; \mathbf{e}: 4-\mathrm{MeOC}_{6} \mathrm{H}_{4}$

## Scheme 1

The structures of the quinazolinonium $N 1$ bromides $\mathbf{3}$ were assigned by IR and NMR spectroscopy.

The IR spectra of the compounds $\mathbf{3}$ present as main characteristics the bands of the carbonyl group in COAr at $1645-1658 \mathrm{~cm}^{-1}$ and at $1707-1730 \mathrm{~cm}^{-1}$ for the CO group in the pyrimidine ring.

The characteristic ${ }^{1} \mathrm{H}$ NMR data are for the protons attached to the quinazoline moiety. The $\mathrm{H}-2$ atom appears strongly deshielded as a singlet at around 10 ppm due to its vicinity to the two nitrogen atoms from the pyrimidine ring. The three protons $\mathrm{H}-5, \mathrm{H}-6$ and $\mathrm{H}-8$ from the quinazoline moiety appear as follows: the atoms H-6 appears as a double doublet with the coupling constants of $J_{56}=8.8 \mathrm{~Hz}$ and $J_{68}=1.6 \mathrm{~Hz}$, due to its coupling with the protons H-5 and $\mathrm{H}-8$ which have the multiplicity of doublet. The ${ }^{13} \mathrm{C}$ NMR spectra present the signals of the carbon atoms in the carbonyl groups in the range $156-159 \mathrm{ppm}$ for the carbonyl group in the amide and 188-190 ppm for the carbonyl group in the aroyl moiety. Also characteristic of the spectra of the salts $\mathbf{3}$ are the carbon C-2, which appears at around 155 ppm (strongly deshielded due to its direct bonding to the two nitrogen atoms) and the carbon C-7 which appears at $\sim 145$ ppm due to its direct bonding with the chlorine atom.

The substituted pyrroles 5 were obtained by one-pot reaction between quinazolinonium bromides $\mathbf{3}$ and acetylenic dipolarophiles $\mathbf{4}$ in 1,2-epoxybutane as reaction medium and acid acceptor (Scheme 2, Table 1).

Scheme 2

Table 1. Tri- and tetra-substituted N -arylpyrroles 5a-l

| Compound | $\mathrm{R}^{1}$ | $\mathrm{R}^{2}$ | E | $\mathrm{Mp}\left({ }^{\circ} \mathrm{C}\right)$ | Yield (\%) |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathbf{5 a}$ | H | H | COMe | $230-232$ | 85 |
| $\mathbf{5 b}$ | $3-\mathrm{NO}_{2}$ | H | COMe | $197-198$ | 76 |
| $\mathbf{5 c}$ | $4-\mathrm{Br}$ | H | COMe | $195-196$ | 61 |
| $\mathbf{5 d}$ | $4-\mathrm{MeO}$ | H | COMe | $208-210$ | 52 |
| $\mathbf{5 e}$ | H | H | $\mathrm{CO}_{2} \mathrm{Et}$ | $182-184$ | 67 |
| $\mathbf{5 f}$ | $3-\mathrm{NO}_{2}$ | H | $\mathrm{CO}_{2} \mathrm{Et}$ | $193-195$ | 43 |
| $\mathbf{5 g}$ | $4-\mathrm{Cl}$ | H | $\mathrm{CO}_{2} \mathrm{Et}$ | $171-173$ | 58 |
| $\mathbf{5 h}$ | $4-\mathrm{Br}$ | H | $\mathrm{CO}_{2} \mathrm{Et}$ | $161-163$ | 65 |
| $\mathbf{5 i}$ | $4-\mathrm{MeO}$ | H | $\mathrm{CO}_{2} \mathrm{Et}$ | $160-162$ | 66 |
| $\mathbf{5 j}$ | $3-\mathrm{NO}_{2}$ | $\mathrm{CO}_{2} \mathrm{Me}$ | $\mathrm{CO}_{2} \mathrm{Me}$ | $199-200$ | 58 |
| $\mathbf{5 k}$ | $4-\mathrm{Br}$ | $\mathrm{CO}_{2} \mathrm{Me}$ | $\mathrm{CO}_{2} \mathrm{Me}$ | $222-224$ | 47 |
| $\mathbf{5 l}$ | $4-\mathrm{Cl}^{\mathbf{5 d}}$ | $\mathrm{CO}_{2} \mathrm{Me}$ | $\mathrm{CO}_{2} \mathrm{Me}$ | $232-234$ | 45 |

The reaction mechanism implies the attack of bromide ion on the 1,2-epoxypropane ring leading to its opening with formation of an alkoxide that generates the ylide $\mathbf{6}$ by its action on the quinazolinonium bromide 3 (Scheme 3). The 1,3-dipolar cycloaddition reaction between the N ylide $\mathbf{6}$ and acetylenic dipolarophiles gives the primary cycloadduct 7 which, under the reaction conditions, suffers a pyrimidine ring opening to the corresponding pyrroles 5 .

## Scheme 3

The structures of the new pyrroles were determined by IR, NMR spectroscopy and X-ray analysis of a representative compound of this series, namely $N$-arylpyrrole 5a. In the IR spectra of $N$-aryl pyrroles 5 the band located in the region $3244-3399 \mathrm{~cm}^{-1}$ is strong evidence for the presence of the NH bond in the secondary amide group.

In the ${ }^{1} \mathrm{H}$ NMR spectra of compounds 5 of tri-substituted pyrroles $\mathbf{5 a} \mathbf{- i}$ the protons $\mathrm{H}-3$ and $\mathrm{H}-5$ of the pyrrole ring appear as two doublets with a coupling constant of 1.6 Hz . The pyrrole structure of the compounds is also emphasized by the signal of Me in the MeNH group which has the multiplicity of a doublet in the range $2.65-2.80 \mathrm{ppm}$ with the coupling constant of $J_{\mathrm{MeNH}}$ $=4.9 \mathrm{~Hz}$. In the case of ethyl esters $\mathbf{5 e} \mathbf{- i}$ the signal for methylenic protons in the ethyl group is a multiplet instead of a quartet. The multiplicity of methylenic protons in the ${ }^{1} \mathrm{H}$ NMR spectrum could be attributed to hindered rotation about the N -Ar bond, as proposed earlier in the case of $N$-arylpyrazole. ${ }^{5}$

The X-ray structure of the representative compound $\mathbf{5 a}^{6-10}$ is shown in Figure 1 (left). Primary torsion angles describing the overall conformation include C2-N1-C9-C14-52.8 ${ }^{\circ}$, C3-C4-C6-O7 3.3 ${ }^{\circ}$, C9-C14-C16-O17-41.3 , N1-C2-C20-O21-19.0 and C2-C20-C22-C23-45.3 (all e.s.d.s $0.2^{\circ}$ ). In this conformation, the bonds $\mathrm{N} 18-\mathrm{H} 18$ and $\mathrm{C} 20=\mathrm{O} 21$ adopt nearly parallel orientations, enabling two molecules of $\mathbf{5 a}$ to form a centrosymmetric hydrogen-bonded dimer (Figure 1, right), in which the unique H -bond is $\mathrm{N} 18-\mathrm{H} 18 \cdots \mathrm{O} 21^{\mathrm{i}}(\mathrm{i}=1 / 2-x, 1 / 2-y, 1-z), \mathrm{N} \cdots \mathrm{O}$ is 2.987(2) $\AA$ and the angle subtended at H 18 is $149^{\circ}$. Weaker, but significant $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds complement the former hydrogen bonds in stabilizing the crystal structure.

Thus, the dimers of $\mathbf{5 a}$ are in turn hydrogen bonded to one another to form infinite ribbons parallel to the crystal $b$-axis via a pair of inversion-related C-H $\cdots \mathrm{O}$ hydrogen bonds. Specifically, the unique H -bond is $\mathrm{C} 25-\mathrm{H} 25 \cdots \mathrm{O}^{\mathrm{ii}}$ (ii $=1 / 2-x, 3 / 2-y, 1-z$ ) with $\mathrm{C} \cdots \mathrm{O} 3.160(2) \AA$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ angle $142^{\circ}$. Additional $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ bonding with $\mathrm{C} \cdots \mathrm{O}$ in the range $3.304(2)-3.407(2) \AA$ occurs, involving atom O 17 as acceptor. Thus, all three oxygen atoms of $\mathbf{5 a}$ engage in hydrogen bonds, stabilizing the crystal structure. Similar hydrogen bonding motifs are likely to occur in the crystals of $\mathbf{5 b} \mathbf{- 5 1}$. Only one significant $\pi$-stacking interaction was evident for $\mathbf{5 a}$, namely that between the chorophenyl rings of two molecules related by the crystallographic twofold rotation axis, with centroid $\cdots$ centroid distance $3.789(1) \AA$. All other ring centroid $\cdots$ centroid distances exceed $4 \AA$.

Figure 1. Structure of 5a with thermal ellipsoids drawn at the $50 \%$ probability level (left) and hydrogen bonded dimer of 5a (right).

## Conclusions

In conclusion, a library of highly substituted pyrroles was synthesized by a simple one-pot reaction. The structure of the new compounds was established by IR and NMR spectroscopy and was confirmed by X-ray analysis, which also provided information regarding their stereochemistry and possible intermolecular interactions in their crystals.

## Experimental Section

General. Melting points were measured on Boëtius hot plate microscope and are uncorrected. IR spectra from samples prepared as KBr pellets were recorded on a Nicolet Impact 410 spectrometer. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded at 300 and 75 MHz respectively on a Varian Gemini 300 BB instrument with $\mathrm{CDCl}_{3}$ as solvent and TMS as internal standard. Elemental analyses for $\mathrm{C}, \mathrm{H}$ and N were obtained using a COSTECH Instruments EAS32. 3-Methyl-7-chloro-4(3H)-quinazolinone was obtained from 4-chloroanthranilic acid and N methylformamide according to the known method. ${ }^{11}$ Activated acetylenic esters, 3-butyn-2-one, 2-bromoacetophenones and 4-chloroanthranilic acid were purchased from Aldrich and used further without purification.

General synthetic procedure, exemplified by 7-chloro-3-methyl-1-(2-phenyl-2-oxoethyl)-4(3H)-quinazolinon-1-ium bromide (3a)
A mixture of 3-methyl-7-chloro-4 $(3 \mathrm{H})$-quinazolinone $\mathbf{1}(1.95 \mathrm{~g}, 10 \mathrm{mmol})$ and 2-bromoacetophenone $2(1.99 \mathrm{~g}, 10 \mathrm{mmol})$ in 40 ml methyl ethyl ketone was heated at reflux for 20 h . The obtained precipitate was filtered and recrystallized from methanol.

6. X-ray reflection intensities for the crystal of $\mathbf{5 a}$ were measured on a Nonius Kappa CCD diffractometer with the crystal cooled in a constant stream of nitrogen vapour at 173(2) K. Lorentz-polarization and absorption corrections ${ }^{8}$ were applied. Programs SHELXS-97 ${ }^{9}$ and SHELXL-97 ${ }^{10}$ were used for structure solution and full-matrix least-squares refinement respectively. All H atoms were located in difference electron density maps and were added in idealized positions in a riding model with isotropic thermal displacement parameters 1.21.5 times those of their parent atoms. All non-H atoms were refined anisotropically.
7. Crystal data for $5 \mathrm{a}: \mathrm{C}_{21} \mathrm{H}_{17} \mathrm{ClN}_{2} \mathrm{O}_{3}, M=380.82,0.42 \times 0.32 \times 0.25 \mathrm{~mm}^{3}$, monoclinic, space group $C 2 / c$ (No. 15), $a=15.5248(4), b=14.5869(4), c=17.4286(4) \AA, \beta=109.1970(10)^{\circ}$, $V=3727.39(16) \AA^{3}, Z=8, D_{\mathrm{c}}=1.357 \mathrm{~g} / \mathrm{cm}^{3}, F_{000}=1584, \mathrm{MoK} \alpha$ radiation, $\lambda=0.71073$ $\AA, \mu=0.229 \mathrm{~mm}^{-1}, T=173(2) \mathrm{K}, 2 \theta_{\max }=56.6^{\circ}, 103650$ reflections collected, 4627 unique $\left(\mathrm{R}_{\mathrm{int}}=0.0425\right)$. Final GooF $=1.048, R_{1}=0.0370, w R_{2}=0.0956, R$ indices based on 3749 reflections with $I>2 \sigma(I)$ (refinement on $F^{2}$ ), 246 parameters, 0 restraints, CCDC deposition no. 809419.
