#### Abstract

3-Aryl-2-sulfanylpropenoic acids 1a-d react with trichloroacetonitrile under various reaction conditions to give different products. Thus, reaction of 1a-d with trichloroacetonitrile in absolute ethanol and in the presence of few drops of triethylamine at room temperature affords 1,3-oxathiolan-5-one derivatives $\mathbf{4 a} \mathbf{- d}$. Whereas, compounds $\mathbf{1 a - d}$ react with trichloroacetonitrile in primary alcohols under reflux to afford the corresponding 2-alkoxy-2-trichloromethylthiazolidin-4-one derivatives 7a-l. Reaction of compounds 1a-d with trichloroacetonitrile or other nitriles 11a-c in refluxing glacial acetic acid gave 5-arylmethylene-2,4-thiazolidinediones 8a-d. The structures of all the newly synthesized products were confirmed based on elemental and spectral data, and a plausible mechanism is postulated to account for their formation. X-ray crystallography was carried out for the products $\mathbf{4 a}$ and $\mathbf{7 b}$.

Keywords: 3-Aryl-2-sulfanylpropenoic acids, trichloroacetonitrile, 1,3-oxathiolan-5-ones, 5-substituted-2-alkoxy-2-trichloromethyl-4-thiazolidinones, X-ray crystallography

## Introduction

3-Aryl-2-sulfanylpropenoic acids are used as intermediates for the synthesis of a variety of heterocyclic sulfur compounds. ${ }^{1-5}$ Additionally, 3-aryl-2-sulfanylpropenoic acids have been found to be useful antidotes for heavy metal poisoning. For example, 3-furyl-2sulfanylpropenoic acid in particular has been shown to protect against cadmium intoxication in rats. ${ }^{6}$ An earlier investigation indicated that post-cadmium exposure treatment with certain 3-aryl-2-sulfanylpropenoic acids is effective in decreasing liver and kidney cadmium burden in rats. ${ }^{7}$ 3-Aryl-2-sulfanylpropenoic acids can inhibit neuraminidases. ${ }^{8}$ As part of our research interest in developing new routes for the synthesis of new heterocycles, ${ }^{9-12}$ we have already reported some of our work on the synthesis, transformations and biological properties of some thiazolidinones and oxathiolanes. ${ }^{13-15}$ The biological significance of this class of compounds
impelled us to continue working on synthesis of new oxathiolane and thiazolidinone derivatives. We report here the reaction of 3-aryl-2-sulfanylpropenoic acids with trichloroacetonitrile and other nitriles under various reaction conditions to give new 1,3-oxathiolanes, which were transformed into the corresponding thiazolidin-4-one derivatives.

## Results and Discussion

The reaction of 3-aryl-2-sulfanylpropenoic acids 1a-d with trichloroacetonitrile in absolute ethanol and in the presence of a few drops of triethylamine as basic catalyst at room temperature afforded the products $\mathbf{4 a - d}$. The structures of the products were confirmed by elemental analyses and spectral data (IR, ${ }^{1} \mathrm{H}$ NMR, ${ }^{13} \mathrm{C}$ NMR, MS and X-ray). For example, the IR spectrum of the isolated product 4a taken as a typical example of the series showed two absorption bands at $v$ 3388 and $3309 \mathrm{~cm}^{-1}$ corresponding to the amino group and one absorption band at $1751 \mathrm{~cm}^{-1}$ corresponding to lactone carbonyl group. The ${ }^{1} \mathrm{H}$ NMR spectrum of the same product revealed a broad singlet signal $\left(2 \mathrm{H}, \mathrm{D}_{2} \mathrm{O}\right.$ exchangeable) at $\delta=4.51 \mathrm{ppm}$ attributable to $\mathrm{NH}_{2}$, and a singlet signal at $\delta=7.81 \mathrm{ppm}$ due to a vinylic proton and the aromatic proton signals. The ${ }^{13} \mathrm{C}$ NMR spectrum of $\mathbf{4 a}$ exhibited the following signals: 113.0 ppm for $\mathrm{C}-1,115.5 \mathrm{ppm}$ for $\mathrm{C}-2,175.5$ ppm for C-3, 133.0 ppm for $\mathrm{C}-4$ and 138.7 ppm for $\mathrm{C}-5$, beside the aromatic carbons. Its mass spectrum showed molecular ion peaks at $m / z 360(\mathrm{M}+1)^{+}$and $361(\mathrm{M}+2)^{+}$consistent with the assigned structure.

Based on these spectral data the oxathiolane structures $\mathbf{4 a - d}$ were assigned to the above reaction products and alternative structure $\mathbf{3}$ could be dismissed (Scheme 1). X-ray analysis of compound $\mathbf{4 a}$ (Figure 1, Table 1) gives conclusive evidence for the assigned structure 4 . The formation of $\mathbf{4}$ is assumed to proceed first via addition of the thiol moiety in sulfanylpropenoic acid derivative 1a to the cyano carbon in trichloroacetonitrile, affording the non-isolable acyclic imine 2. This, in turn cyclizes to the final isolated product 4 via addition of the oxygen nucleophile to the activated azomethine group.

On the other hand, it was found that compounds 1a-d react with trichloroacetonitrile in absolute ethanol in the presence of few drops of triethylamine at refluxing temperature to afford pale yellow crystalline products. It was expected that this reaction would afford thiazole derivatives $\mathbf{3}$. The IR spectrum of $\mathbf{7 b}$ taken as a typical example of the reaction products showed an absorption band at $v 1680 \mathrm{~cm}^{-1}$ attributable to a lactam carbonyl group. The ${ }^{1} \mathrm{H}$ NMR spectrum of the same product revealed a triplet signal at $\delta=1.22 \mathrm{ppm}$ and a quartet signal at $\delta=$ 3.70 attributable to ethoxy protons. A singlet signal $\left(1 \mathrm{H}, \mathrm{D}_{2} \mathrm{O}\right.$ exchangeable) appeared at $\delta=$ 10.46 ppm , attributable to an NH , a singlet signal at $\delta=7.47 \mathrm{ppm}$ due to vinylic proton and a singlet signal at $\delta=6.10$ due to methylene $\left(\mathrm{O}-\mathrm{CH}_{2}-\mathrm{O}\right)$ protons, besides the aromatic protons. The ${ }^{13} \mathrm{C}$ NMR spectrum of $\mathbf{7 b}$ exhibited the following signals: 113.0 ppm for $\mathrm{C}-1,115.7 \mathrm{ppm}$ for $\mathrm{C}-2$, 176.6 ppm for $\mathrm{C}-3,133.8 \mathrm{ppm}$ for $\mathrm{C}-4,137.5 \mathrm{ppm}$ for $\mathrm{C}-5,111.1$ for methylene $\left(\mathrm{O}-\mathrm{CH}_{2}-\mathrm{O}\right)$, and
aromatic carbon signals. The mass spectrum showed molecular ion peaks at $\mathrm{m} / \mathrm{z} 395(\mathrm{M})^{+}$and $397(\mathrm{M}+2)^{+}$consistent with the assigned structure.

## Scheme 1

An X-ray crystallographic study of a single crystal of 7b (Figure 2, Table 2) confirmed the structure deduced from NMR studies. Compounds 7a-d can also be obtained by refluxing 4a-d in absolute ethanol in the presence of triethylamine. Similarly, refluxing of $\mathbf{4 a - d}$ in other alcohols like methanol or $n$-propanol in the presence of few drops of triethylamine afforded 2-alkoxy-2-trichloromethyl-4-thiazolidinone derivatives 7e-l. Transformation of 4a-d into 7a-l is assumed to proceed via ring opening of lactone ring by alcohol to afford the non-isolable acyclic intermediates, then cyclization with elimination of water to afford the final isolated products 7.

It was of interest to extend this study to reactions conducted in acetic acid and we found that heating 1a-d with trichloroacetonitrile in acetic acid at reflux afforded coloured solid products. The structure of the isolated products was confirmed by elemental analysis and spectral data (IR, ${ }^{1} \mathrm{H}$ NMR and MS). The IR spectra of the isolated products showed in each case absorption at $v_{\max }$ 3176-3216 due to NH group and absorption at $v_{\max .}$ 1753-1679 $\mathrm{cm}^{-1}$ due to carbonyl groups.

The ${ }^{1} \mathrm{H}$ NMR spectra of these products revealed in each case a broad singlet signal $\left(1 \mathrm{H}, \mathrm{D}_{2} \mathrm{O}\right.$ exchangeable) at $\delta \sim 11.25-12.90$ attributable to NH , besides a vinylic CH proton at $\delta \sim 7.56$ 7.71 ppm . The mass spectra together with elemental analyses confirmed the structures 8a-d. These structures were chemically confirmed by an alternative method via condensation of 2,4thiazolidinedione (9) with aromatic aldehydes 10a-d in glacial acetic acid in the presence of anhydrous sodium acetate to give products corresponding in all respects ( mp , mixed mp and IR) with products ${ }^{16,17} \mathbf{8 a - d}$.

The formation of structure $\mathbf{8}$ is assumed to proceed via addition of the thiol moiety in the sulfanylpropenoic acid to the cyano carbon in trichloroacetonitrile, then cyclization with elimination of water to give non-isolable product 2. Acid hydrolysis then affords the 5-arylidene-2,4-thiazolidinediones 8 .

## Scheme 2

The reaction of 1a-d with other nitriles such as 2-(1-amino-2,2,2trichloroethylidene)malononitrile 11a in refluxing acetic acid, afforded products identical in all respects (TLC, mp, mixed mp, IR) with $\mathbf{8 a - d}$. Similarly, compounds $\mathbf{1 a - d}$ were allowed to react with ethyl 3-amino-4,4,4-trichloro-2-cyanobut-2-enoate 11b or 3-(1-amino-2,2,2trichloroethylidene) pentane-2,4-dione 11c under the same reaction conditions to afford products completely identical (TLC, mp, mixed mp, IR) with 8a-d.

Compounds 8a-d are assumed to be formed via elimination of chloroform, followed by cyclization with elimination of water, then acid hydrolysis with elimination of active nitrile molecule to afford $\mathbf{8}$ (Scheme 3).

## Scheme 3

## Experimental Section

General. Melting points were determined on an Electrothermal 9100 apparatus. The IR spectra were recorded as KBr pellets on a Perkin-Elmer 1430 spectrophotometer. The ${ }^{1} \mathrm{H}$ NMR spectra were taken on a Varian Gemini $300-\mathrm{MHz}$ spectrometer in DMSO- $d_{6}$ using TMS as internal standard. Mass spectra were measured on a Shimadzu GCMS-GB 1000 PX (70 ev). Elemental analyses were obtained using an Elementar CHNS analyzer Vario EL III (Germany), at the Microanalyses Center of Cairo University, Giza, Egypt. The X-ray crystal analysis was carried out at Dokki National Centre (NRC) at Dokki, Giza, Egypt. 3-Aryl-2-sulfanylpropenoic acids were synthesized according to literature procedures. ${ }^{18}$

## Synthesis of 2-amino-2-trichloromethyl-4-arylmethylene-1,3-oxathiolan-5-one derivatives

 (4a-d). General procedureTo a mixture of $\mathbf{1 a - d}(10 \mathrm{mmol})$ and trichloroacetonitrile ( 10 mmol ) in 20 ml of absolute ethanol, 0.2 ml of triethylamine was added. The reaction mixture was stirred at room temperature for 1 h (TLC). The solid formed was filtered off, washed with ethanol, and recrystallized from the appropriate solvent to afford the 1,3-oxathiolan-5-ones 4a-d.

Found: C, 38.38; H, 3.45; Cl, 28.75; N, 3.52; S, 17.42.
Reaction of 1a-d with nitriles: Synthesis of 5-arylidene-2,4-thiazolidine derivatives (8a-d)
A mixture of $\mathbf{1 a - d}(10 \mathrm{mmol})$ and trichloroacetonitrile or 2-(1-amino-2,2,2trichloroethylidene)malononitrile 11a or ethyl 3-amino-4,4,4-trichloro-2-cyanobut-2-enoate 11b or 3-(1-amino-2,2,2-trichloroethylidene)pentane-2,4-dione 11c ( 10 mmol ) in 20 ml of glacial acetic acid was refluxed for 2 h (TLC). The coloured solid precipitated, was filtered off, and recrystallized from the proper solvent.
5-(4-Chlorophenylmethylene)-2,4-thiazolidinedione (8a). Yellow crystals; (82\%), mp, 241$243{ }^{\circ} \mathrm{C}(\mathrm{AcOH})$; IR (KBr): $3146(\mathrm{NH}), 1753(\mathrm{CO}), 1721 \mathrm{~cm}^{-1}(\mathrm{CO}) .{ }^{1} \mathrm{H}$ NMR (DMSO- $\left.d_{6}\right): \delta=$
7.37 (d, 2H, $J=7.8 \mathrm{~Hz}, \operatorname{Ar}$ ), 7.71 (s, 1H), 7.97 (d, 2H, $J=7.8 \mathrm{~Hz}, \mathrm{Ar}), 10.25$ (s, 1H, NH). Anal. Calcd. for $\mathrm{C}_{10} \mathrm{H}_{6} \mathrm{ClNO}_{2} \mathrm{~S}_{2}$ : C, $50.11 ; \mathrm{H}, 2.52 ; \mathrm{Cl}, 14.79 ; \mathrm{N}, 5.84 ; \mathrm{S}, 13.38$. Found: C, 50.20; H, 2.34; N, 5.60; S, 13.56.

5-(1,3-Benzodioxol-5-ylmethylene)-2,4-thiazolidinedione (8b). Yellow crystals; (84\%); mp 246-248 ${ }^{\circ} \mathrm{C}(\mathrm{AcOH})$; IR (KBr): $3141(\mathrm{NH}), 1739(\mathrm{CO}), 1697 \mathrm{~cm}^{-1}(\mathrm{CO}) .{ }^{1} \mathrm{H}$ NMR (DMSO- $d_{6}$ ): $\delta=6.10(\mathrm{~s}, 2 \mathrm{H}), 6.93(\mathrm{~d}, 1 \mathrm{H}, J=8.2 \mathrm{~Hz}), 7.25(\mathrm{~d}, 1 \mathrm{H}, J=9.6 \mathrm{~Hz}), 7.58(\mathrm{~s}, 1 \mathrm{H}), 7.77(\mathrm{~s}, 1 \mathrm{H})$, $12.90(\mathrm{~s}, 1 \mathrm{H}, \mathrm{NH}) ; \mathrm{MS}: m / z(\%) ; 249\left(\mathrm{M}^{+}, 0.21\right), 224$ (22.79), 206 (1.96), 193 (2.38), 178 (100), 165 (4.26), 149 (13.05), 135 (10.81), 120 (18.21), 105 (2.09), 93 (4.65), 77 (11.09), 69 (7.59), 50 (4.38). Anal.Calcd. for $\mathrm{C}_{11} \mathrm{H}_{7} \mathrm{NO}_{4} \mathrm{~S}: \mathrm{C}, 53.01 ; \mathrm{H}, 2.83$; N, 5.62; S, 12.86. Found: C, 53.22; H, 2.61; N, 5.95; S, 12.63.

5-(Furyl-2-ylmethylene)-2,4-thiazolidinedione (8c). Brown crystals; (68\%); mp 235-237 ${ }^{\circ} \mathrm{C}$ $(\mathrm{AcOH}) ;$ IR $(\mathrm{KBr}): 3133(\mathrm{NH})$ and $1725(\mathrm{CO}), 1685 \mathrm{~cm}^{-1}(\mathrm{CO}) .{ }^{1} \mathrm{H}$ NMR (DMSO- $\left.d_{6}\right): \delta=6.90-$ $8.21(\mathrm{~m}, 3 \mathrm{H}), 7.56(\mathrm{~s}, 1 \mathrm{H}), 11.48(\mathrm{~s}, 1 \mathrm{H}, \mathrm{NH})$. Anal.Calcd. for $\mathrm{C}_{8} \mathrm{H}_{5} \mathrm{NO}_{3} \mathrm{~S}: \mathrm{C}, 49.23 ; \mathrm{H}, 2.58$; N, 7.18; S, 18.43. Found: C, 49.45; H, 2.81; N, 7.42; S, 18.24.

5-(Thienyl-2-ylmethylene)-2,4-thiazolidinedione (8d). Yellow crystals; (70\%); mp 230-232 ${ }^{\circ} \mathrm{C}$ (EtOH); IR (KBr): $3125(\mathrm{NH})$ and $1733(\mathrm{CO}), 1679 \mathrm{~cm}^{-1}(\mathrm{CO}) .{ }^{1} \mathrm{H}$ NMR (DMSO- $d_{6}$ ): $\delta=7.50-$ $8.16(\mathrm{~m}, 3 \mathrm{H}), 7.61(\mathrm{~s}, 1 \mathrm{H}), 11.44(\mathrm{~s}, 1 \mathrm{H}, \mathrm{NH})$. Anal.Calcd. for $\mathrm{C}_{8} \mathrm{H}_{5} \mathrm{NO}_{2} \mathrm{~S}_{2}$ : C, 45.48; H, 2.39; N, 6.63; S, 30.36. Found: C, 45.66; H, 2.18; N, 6.86; S, 30.57.

Crystallographic data for the structural analysis of compounds $\mathbf{4 a}$ and $\mathbf{7 b}$ has been deposited with the Cambridge Crystallographic Data centre (CCDC) under the numbers 808332 and 808807, respectively. Copies of the information may be obtained free of charge from the Director, CCDC, 12 Union Road, Cambridge CB2 IEZ, UK (Fax: +44-01223-336033; e-mail: deposit@ccdc.cam.ac.uk or www: http://www.ccdc.cam.ac.uk).
