# Synthesis of certain novel 4H-pyrano[3,2-h]quinoline derivatives 

Ahmed M. El-Agrody * and Abdullah M. Al-Ghamdi<br>Chemistry Department, Faculty of Scinece, King Khalid University, 9004, Abha, Saudi Arabia E-mail: elagrody_am@yahoo.com

DOI: $\underline{\text { http://dx.doi.org/10.3998/ark.5550190.0012.b12 }}$

#### Abstract

Treatment of 8-hydroxyquinoline 1a and 8-hydroxy-2-methylquinoline $\mathbf{1 b}$ with $\alpha$-cyano- $p$ chloro/bromocinnamonitriles 2a,b provided $4 H$-pyrano[3,2-h]quinoline-3-carbonitrile derivatives $\mathbf{3 a - d}$, while treatment of $(E) 2$-(4-chlorostyryl)-8-hydroxyquinoline 7 with $\alpha$-cyano- $p$ chloro/bromocinnamonitriles 2a,b and ethyl $\alpha$-cyano- $p$-chloro/bromocinnamates 2d,e provided $4 H$-pyrano[3,2-h]quinoline-3-carbonitrile derivatives 8a,b and ethyl 4 H -pyrano[3,2-h]quinoline3 -carboxylate derivatives $\mathbf{9 a , b}$ respectively. Interaction of 8 -hydroxyquinoline $\mathbf{1 a}$ and 8 -hydroxy-2-methylquinoline $\mathbf{1 b}$ with $\alpha$-cyano- $p$-fluorocinnamonitrile 2c afforded 2-[4-(piperidin1 -yl)benzylidene]malononitrile 5 via a nucleophilic aromatic substitution reaction. The reactivity of 2-hydroxyquinoline and its 2 -substituted derivatives towards $\alpha$-cyano- $p$-chloro/bromocinnamonitriles and ethyl $\alpha$-cyano- $p$-chloro/bromocinnamates are discussed in this work. Structures of these compounds were established on the basis of IR, ${ }^{1} \mathrm{H}$ NMR, ${ }^{13} \mathrm{C}$ NMR, ${ }^{13} \mathrm{C}$ NMR-DEPT and MS data.

Keywords: 8-Hydroxyquinoline, 8-hydroxy-2-methylquinoline, (E) 2-(4-chlorostyryl)-8hydroxyquinoline, $\alpha$-cyano- $p$-halocinnamonitriles/ethyl $\alpha$-cyano- $p$-halocinnamates, $4 H$-pyrano-[3,2-h]quinoline derivatives, 2-[4-(piperidin-1-yl)benzylidene]malononitrile

## Introduction

Quinoline moiety is present in many classes of biologically active compounds ${ }^{1}$. The biological activity of these quinoline derivatives depends not only on the bicyclic hetero-aromatic pharmacophore but also on the nature of the peripheral substituent and their spatial relationship. They also exhibit antimalarial ${ }^{2}$, antitumor ${ }^{3}$, antioxidant ${ }^{4}$, antileishmanial ${ }^{5}$ and antiplatelet activities ${ }^{6}$. In addition they function as pharmacologically active synthetic compounds ${ }^{7}$ such as DNA binding capabilities ${ }^{8}$ and DNA-intercalating carrier ${ }^{9}$. A series of compounds derived from 8 -hydroxyquinoline as potential HIV-1 integrate inhibitors were synthesized recently ${ }^{10}$. In
addition styrylquinoline derivatives have gained strong attention recently due to their activities as perspective HIV integrase inhibitors ${ }^{11}$ and also, for their extensive biological activities. ${ }^{1 \mathrm{~b}-\mathrm{d}, 11 \mathrm{c}}$

In continuation of the previous works ${ }^{12-26}$, it seemed interesting to synthesize new $4 H$ -pyrano[3,2-h]quinoline derivatives by using $\alpha$-cyano- $p$-halocinnamonitriles and ethyl $\alpha$-cyano-$p$-halocinnamates and evaluatation of their antimicrobial and antitumor activities. The observation of the reactivity of 2-hydroxyquinoline and its 2 -substitued derivatives towards $\alpha$ -cyano- $p$-halocinnamonitriles and ethyl $\alpha$-cyano- $p$-halocinnamates are discussed in this work.

## Results and Discussion

Treatment of 8-hydroxyquinoline 1a and 8-hydroxy-2-methylquinoline $\mathbf{1 b}$ with $\alpha$-cyano- $p$ chloro/bromocinnamonitrile $\mathbf{2 a , b}$ in ethanolic piperidine under reflux afforded 2-amino-4-(4-chloro/bromophenyl)-4H-pyrano[3,2-h]quinoline-3-carbonitrile 3a,b and 2-amino-4-(4-chloro-/bromophenyl)-9-methyl-4H-pyrano[3,2-h]quinoline-3-carbonitrile 3c,d, while treatment of 1a,b with ethyl $\alpha$-cyano- $p$-chloro/bromo/fluorocinnamate $\mathbf{2 d}$-f in ethanolic piperidine under reflux were unsuccessful, ethyl 2-amino-4-(4-halophenyl)-4H-pyrano[3,2-h]quinoline-3-carboxylate 4a-c and 2-amino-4-(4-halophenyl)-9-methyl-4 H -pyrano[3,2-h]quinoline-3-carboxylate 4d-f were not formed ${ }^{27}$ (Scheme 1).

Scheme 1. Synthesis of 4H-pyrano[3,2-h]quinoline derivatives 3a-d.

The formation of $\mathbf{3}$ indicates that the phenolate anion (C-7) of $\mathbf{1 a}$ and $\mathbf{1 b}$ attacks at the $\beta$ carbon of 2 to yield an acyclic Michael adduct, which underwent cyclization as shown in (Scheme 2) to give 3.

Scheme 2. Mechanism formation of compounds 3.

Furthermore, reaction of $\mathbf{1 a , b}$ with $\alpha$-cyano- $p$-fluorocinnamonitrile $\mathbf{2 c}$ afforded 2-[4-(piperidin-1-yl)benzylidene]malononitrile 5 instead of the formation of 2-amino-4-(4-fluorophenyl)-4H-pyrano[3,2-h]quinoline-3-carbonitrile $\mathbf{3 e}$ and the 2-amino-4-(4-fluorophenyl)9 -methyl-4H-pyrano[3,2-h]quinoline-3-carbonitrile 3f. In the case of compound 5 the fluorine atom of 2c had simply been displaced by piperidine ${ }^{28-31}$ via a nucleophilic aromatic substitution reaction (Scheme 3). Attempts to react 1a,b with 5 was unsuccessful, 2-amino-4-(4-piperidin-1-ylphenyl)-4H-pyrano[3,2-h]quinoline-3-carbonitrile $\mathbf{3 g}$ and 2-amino-4-(4-piperidin-1-ylphenyl)-9-methyl-4H-pyrano[3,2-h]quinoline-3-carbonitrile $\mathbf{3 h}$ were not formed ${ }^{28}$ (Scheme 3).

Scheme 3. Synthesis of 2-[4-(piperidin-1-yl)-benzylidene]malononitrile.

Structure of 5 was also supported by an independent synthesis of the same compound by nucleophilic substitution of the fluorine atom of $\mathbf{2 c}$ with piperidine ${ }^{28}$ in ethanol under reflux (m.p. and mixed m.p.) (Scheme 3).

Structure $\mathbf{3}$ was established on the basis of spectral data. The IR spectra of $\mathbf{3 a} \mathbf{- d}$ showed the presence of a $\mathrm{NH}_{2}$ stretch at $\mathrm{v} 3464-3395,3344-3310 \mathrm{~cm}^{-1}$ and a CN stretch at $\mathrm{v} 2196-2188 \mathrm{~cm}^{-1}$. NMR spectra of 3a-d showed characteristic signals for $4 H$-pyran: singlets at $\delta 4.98-4.82 \mathrm{ppm}$ in the ${ }^{1} \mathrm{H}$ NMR and $41.51-40.46 \mathrm{ppm}$ in the ${ }^{13} \mathrm{C}$ NMR. The mass spectra of compounds $\mathbf{3 a}$-d gave additional evidences for the proposed structures.

Condensation of 8-hydroxy-2-methylquinoline 1b with p-chlorobenzaldehyde in acetic anhydride under reflux give $(E)$ 2-(4-chlorostyryl)-8-hydroxyquinoline 7 via the intermediate ( $E$ ) 8 -acetoxy-2-(4-chlorostyryl)quinoline 6, while condensation of $\mathbf{1 b}$ with $p$-chlorobenzaldehyde under Microwave irradiation furnished $7{ }^{1 f, g}$ (Scheme 4).

The relative $(E)$ configuration of compounds 6 and 7 were established from the coupling constant values ( $J=17 \mathrm{~Hz}$ ) for $\mathbf{6}$ and $(J=16 \mathrm{~Hz})$ for 7 .

Scheme 4. Preparation of (E) 8-acetoxy-2-(4-chlorostyryl)quinoline 6 and (E) 8-hydroxy-2-(4chlorostyryl)quinoline 7.

The structures of $\mathbf{6}$ and 7 were established on the basis of spectral data. The IR spectra of $\mathbf{6}$ showed the presence of a CO stretch at $v 1760 \mathrm{~cm},{ }^{-1}$ while for 7 showed the appearance of a OH stretch at $v 3349 \mathrm{~cm} .{ }^{-1}$ The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra of 6 revealed the presence of signals at $\delta$ $7.63(\mathrm{~d}, J=17 \mathrm{~Hz}, 1 \mathrm{H},=\mathrm{CH}), 7.47(\mathrm{~d}, J=17 \mathrm{~Hz}, 1 \mathrm{H},=\mathrm{CH}), 2.60 \mathrm{ppm}\left(\mathrm{s}, 3 \mathrm{H}, \mathrm{COCH}_{3}\right)$ and $134.42(=\mathrm{CH}), 129.35(=\mathrm{CH}), 21.06 \mathrm{ppm}\left(\mathrm{CH}_{3}\right)$. The ${ }^{13} \mathrm{C}$ NMR-DEPT spectrum at $45^{\circ}, 90^{\circ}$ and $135^{\circ}$ of $\mathbf{6}$ provided additional evidence in support of the proposed structure. The ${ }^{13} \mathrm{C}$ NMRDEPT spectrum of 6 at $\delta 135^{\circ} \mathrm{CH}, \mathrm{CH}_{3}$ [positive (up)], $\mathrm{CH}_{2}$ [negative (down)], revealed the following signals at $\delta 134.42(=\mathrm{CH} \uparrow), 129.35(=\mathrm{CH} \uparrow), 21.06\left(\mathrm{CH}_{3} \uparrow\right)$, while at $90^{\circ}$ only CH signals are positive (up) and showed at $\delta 134.42(=\mathrm{CH} \uparrow), 129.35(=\mathrm{CH} \uparrow)$ and at $45^{\circ}\left(\mathrm{CH}, \mathrm{CH}_{2}\right.$ and $\mathrm{CH}_{3}$ positive) revealed signals at $\delta 134.42(=\mathrm{CH} \uparrow), 129.35(=\mathrm{CH} \uparrow), 21.06\left(\mathrm{CH}_{3} \uparrow\right)$. Characteristic resonances were observed at $\delta 9.85(\mathrm{bs}, 1 \mathrm{H}, \mathrm{OH}), 8.14(\mathrm{~d}, J=16 \mathrm{~Hz}, 1 \mathrm{H},=\mathrm{CH})$,
$7.51 \mathrm{ppm}(\mathrm{d}, J=16 \mathrm{~Hz}, 1 \mathrm{H},=\mathrm{CH})$ and $135.15(=\mathrm{CH}), 131.62 \mathrm{ppm}(=\mathrm{CH})$ for 7. The mass spectra of compounds 6 and 7 gave additional evidences for the proposed structures.

Treatment of (E) 2-(4-chlorostyryl)-8-hydroxyquinoline 7 with 2a,b,d,e in ethanolic piperidine under reflux afforded (E) 2-amino-4-(4-chloro/bromophenyl)-9-(4-chlorostyryl)-4H-pyrano[3,2-h]quinoline-3-carbonitrile 8a,b and ethyl (E) 2-amino-4-(4-chloro/bromophenyl)-9-(4-chlorostyryl)-4H-pyrano[3,2-h]quinoline-3-carboxylate 9a,b respectively (Scheme 5).

The relative $(E)$ configuration of compounds $\mathbf{8}$ and 9 were established from the coupling constant values ( $J=16.5 \mathrm{~Hz}$ ) for $\mathbf{8 a}, 9 \mathbf{9}$ and $(J=16 \mathrm{~Hz})$ for $\mathbf{8 b}, \mathbf{9 b}$.

Scheme 5. Synthesis of 9-(4-chlorostyryl)-4H-pyrano[3,2-h]quinoline derivatives 8a,b and 9a,b.

The structures $\mathbf{8}$ and $\mathbf{9}$ were established on the basis of spectral data. The IR spectra of $\mathbf{8 a , b}$ showed the appearance of the a $\mathrm{NH}_{2}$ stretch at $v 3417-3384,3315-3310,3199-3182 \mathrm{~cm},{ }^{-1}$ a CN stretch at $v$ 2198-2189 cm, ${ }^{-1}$ while a $\mathrm{NH}_{2}$ stretch at $v$ 3409-3380, 3349-3296 $\mathrm{cm}^{-1}$ and a CO stretch at $v$ 1677-1643 $\mathrm{cm}^{-1}$ for $\mathbf{9 a , b}$. The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra of $\mathbf{8 a , b}$ and $\mathbf{9 a , b}$ revealed the presence of $4 H$ signals at $\delta 5.09-5.00(\mathrm{~s}, 1 \mathrm{H}, \mathrm{H}-4)$ and $40.71-40.09 \mathrm{ppm}(\mathrm{C}-4)$. In compounds 9a,b the ester group gave ${ }^{1} \mathrm{H}$ signals at $4.13-4.01\left(\mathrm{q}, J=7 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 1.22-1.10(\mathrm{t}, J=7 \mathrm{~Hz}$, $\left.3 \mathrm{H}, \mathrm{CH}_{3}\right)$ with the corresponding signals in the ${ }^{13} \mathrm{C}$ spectra at $\delta 59.59-58.75\left(\mathrm{CH}_{2}\right)$ and $14.39-$ $14.27 \mathrm{ppm}\left(\mathrm{CH}_{3}\right)$ respectively. The ${ }^{13} \mathrm{C}$ NMR-DEPT spectra at $45^{\circ}, 90^{\circ}$ and $135^{\circ}$ of compounds $\mathbf{8 a}, \mathbf{b}$ provided additional evidence in support of the proposed structures. Also,t he mass spectra of compounds $\mathbf{8}$ and 9 gave additional evidences for the proposed structures.

From the experimental observations (reaction time and yield), the authors pointed out that, the tendency of the 8 -hydroxyquinoline $\mathbf{1 a}$ and 2 -substituted- 8 -hydroxyquinoline $\mathbf{1 b}, \mathbf{7}$ towards
the electrophilic $\beta$-carbon of $\alpha$-cyano- $p$-chloro/bromocinnamonitriles $\mathbf{2 a}, \mathbf{b}$ and ethyl $\alpha$-cyano- $p$ chloro/bromocinnamates $\mathbf{2 d}, \mathbf{e}$ follows the following sequence:

8-Hydroxy-2-styrylquinoline > 8-hydroxyquinoline > 8-hydroxy-2-methylquinoline

Thus, the reactivity was enhanced with the presence of the styryl group in the 2-position and deactivated with the methyl group in the 2-position and this was explained through the mesomeric effect between the quinoline- $N$ and the hydroxyl group in the 8-position as shown in (Scheme 6).

$$
\begin{array}{ll}
\mathrm{a}, \mathrm{Ar}=p-\mathrm{ClC}_{6} \mathrm{H}_{4} & \mathrm{X}=\mathrm{CN} \\
\mathrm{~b}, \mathrm{Ar}=p-\mathrm{BrC}_{6} \mathrm{H}_{4} & \mathrm{X}=\mathrm{CN} \\
\mathrm{~d}, \mathrm{Ar}=p-\mathrm{ClC}_{6} \mathrm{H}_{4} & \mathrm{X}=\mathrm{CO}_{2} \mathrm{Et} \\
\mathrm{e}, \mathrm{Ar}=p-\mathrm{BrC}_{6} \mathrm{H}_{4} & \mathrm{X}=\mathrm{CO}_{2} \mathrm{Et}
\end{array}
$$

Scheme 6. The reactivity of (E) 2-(4-chlorostyryl)-8-hydroxyquinoline 7.

Also, this observation was supported by the easy attacks of phenolate anion (C-7) of 7 at the $\beta$-carbon of ethyl $\alpha$-cyano- $p$-chloro/bromocinnamates 2d,e rather than $\mathbf{1 a}$ and $\mathbf{1 b}$ to yield an acyclic Michael adduct, which underwent cyclization to give 9 .

## Conclusions

In this paper we report the synthesis of some $4 H$-pyrano[3,2-h]quinoline derivatives $\mathbf{3 a - d}, \mathbf{8 a}, \mathbf{b}$ and $\mathbf{9 a}, \mathbf{b}$ via interaction of 8 -hydroxyquinoline $\mathbf{1 a}$ and 2 -substituted-8-hydroxyquinoline $\mathbf{1 b}, 7$ with $\alpha$-cyano- $p$-chloro/bromocinnamonitriles $\mathbf{2 a , b}$ and ethyl $\alpha$-cyano- $p$-chloro/bromocinnamates 2d,e. The tendency of the 8 -hydroxyquinoline and 2 -substituted- 8 -hydroxyquinoline towards the electrophilic $\beta$-carbon of $\alpha$-cyano- $p$-chloro/bromocinnamonitriles and ethyl $\alpha$-cyano-$p$-chloro/bromocinnamates illustrated that the order of reactivity of 8-hydroxyquinoline 1a and 2-substituted-8-hydroxyquinoline $\mathbf{1 b}, \mathbf{7}$ follows the following sequence:

8-Hydroxy-2-styrylquinoline > 8-hydroxyquinoline > 8-hydroxy-2-methylquinoline

This is can be explained through the mesomeric effect between the quinoline- $N$ and the hydroxyl group in the 8-position.

## Experimental Section

General. Melting points were determined with a Stuart Scientific Co. Ltd apparatus. IR spectra were determined as KBr pellets on a Jasco FT/IR 460 plus spectrophotometer. ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on using a Bruker AV 500 MHz spectrometer using tetramethylsilane (TMS) as an internal reference and results are expressed as $\delta(\mathrm{ppm})$ values. ${ }^{13} \mathrm{C}$ NMR spectra were obtained using distortionless enhancement by polarization transfer (DEPT), with this technique, the signals of $\mathrm{CH} \& \mathrm{CH}_{3}$ carbon atoms appears normal (up) and the signal of carbon atoms in $\mathrm{CH}_{2}$ environments appears negative (down). The MS were measured on a Shimadzu GC/MS-QP5050A spectrometer. Elemental analyses for $\mathrm{C}, \mathrm{H}$ and N were performed on a Perkin-Elmer 240 microanalyser in the Faculty of Science Cairo University.

General procedure for the preparation of $4 H$-pyrano[3,2-h] quinoline derivatives (3a-d) and 2-[4-(piperidin-1-yl)benzylidene]malononitrile (5)
A solution of 8-hydroxyquinoline 1a or 8-hydroxy-2-methylquinoline $\mathbf{1 b}(0.01 \mathrm{mmol})$ in EtOH ( 30 ml ) was treated with $\alpha$-cyano- $p$-chloro/bromo/fluorocinnamonitriles $\mathbf{2 a}-\mathbf{c}(0.01 \mathrm{mmol})$ and piperidine ( 0.5 ml ). The reaction mixture was heated until complete precipitation occurred (reaction times: 60 min .). The solid product which formed was collected by filtration and recrystallised from benzene for compounds $\mathbf{3 a - d}$ and from ethanol for compound $\mathbf{5}$. The physical and spectral data of compounds $\mathbf{3 a - d}$ and $\mathbf{5}$ are as follows:
2-Amino-4-(4-chlorophenyl)-4H-pyrano[3,2-h]quinoline-3-carbonitrile (3a). Buff needles, yield $83 \%$, m.p. $249-250{ }^{\circ} \mathrm{C}$; [Lit. M.p. $\left.223-224{ }^{\circ} \mathrm{C}\right]{ }^{27}$; IR $(\mathrm{KBr}) v\left(\mathrm{~cm}^{-1}\right): 3409,3310,\left(\mathrm{NH}_{2}\right)$, 3060, 2972, $2870(\mathrm{CH}), 2190(\mathrm{CN})$; ${ }^{1} \mathrm{H}$ NMR ( 500 MHz , DMSO- $d_{6}$ ) $\delta_{H}: 8.95-7.16(\mathrm{~m}, 9 \mathrm{H}$, aromatic), $5.00\left(\mathrm{bs}, 2 \mathrm{H}, \mathrm{NH}_{2}\right), 4.98(\mathrm{~s}, 1 \mathrm{H}, \mathrm{H}-4) ;{ }^{13} \mathrm{C}$ NMR ( 125 MHz , DMSO- $d_{6}$ ) $\delta \mathrm{c}: 160.33(\mathrm{C}-$ 2), 150.24 (C-10b), 144.52 (C-9), 137.46 (C-10a), 135.97 (C-7), 128.71 (C-5), 127.75 (C-6a), 123.66 (C-4a), 122.18 (C-8), 121.35 (C-6), 120.35 (CN), 55.66 (C-3), 40.64 (C-4), 143.01, 131.68, 129.57, 126.73 (aromatic); Anal. Preparation of 2-[4-(piperidin-1-yl)benzylidene]malononitrile (5) from $\alpha$-cyano-p-fluorocinnamonitriles (2c). This compound was prepared according to the literature procedure ${ }^{28}$.

## Reaction of 8-hydroxy-2-methylquinoline (1b) with p-chlorobenzaldehyde

Method A. A mixture of 8-hydroxy-2-methylquinoline 1b ( 0.01 mmol ), $p$-chlorobenzaldehyde, $(0.08 \mathrm{mmol})$ and acetic anhydride ( 100 ml ) was heated at $150{ }^{\circ} \mathrm{C}$ for 30 h (TLC monitoring). After cooling, the solvent was removed in vacuum, and the residue was recrystallised from ethanol/benzene to give 6. Compound 6 was heated at $100{ }^{\circ} \mathrm{C}$ for 1 h (TLC monitoring) in pyridine/water ( $\mathrm{v} / \mathrm{v}=4: 1$ ) $(100 \mathrm{ml})$. After cooling, the solvent was removed in vacuum to provide the crude product which recrystallised from ethanol to give 7. The physical and spectral data of compounds $\mathbf{6}$ and $\mathbf{7}$ are as follows:
(E) 8-Acetoxy-2-(4-chlorostyryl)quinoline (6). Pale yellow crystals, yield 41\%; m.p. 100-101 ${ }^{\circ} \mathrm{C}$; IR (KBr) v ( $\mathrm{cm}^{-1}$ ): 3090, 3050, 3010, 2942, 2961 (CH), 1760 (CO); ${ }^{1} \mathrm{H}$ NMR ( 500 MHz ,
$\left.\mathrm{CDCl}_{3}\right) \delta_{\mathrm{H}}: 8.12-7.38(\mathrm{~m}, 9 \mathrm{H}$, aromatic), $7.63(\mathrm{~d}, J=17 \mathrm{~Hz}, 1 \mathrm{H},=\mathrm{CH}), 7.47(\mathrm{~d}, J=17 \mathrm{~Hz}, 1 \mathrm{H}$, $=\mathrm{CH}), 2.60\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{COCH}_{3}\right) ;{ }^{13} \mathrm{C}$ NMR ( $125 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta \mathrm{c}: 169.83(\mathrm{CO}), 155.45(\mathrm{C}-2)$, 147.35 (C-8), 140.87 (C-1a), 136.53 (C-4), 134.42 (=CH), 129.35 (=CH), 128.63 (C-4a), 125.88 (C-6), 125.57 (C-5), 121.78 (C-7), $120.20(\mathrm{C}-3), 21.06\left(\mathrm{CH}_{3}\right), 134.96,133.47,129.01,128.57$ (aromatic); ${ }^{13} \mathrm{C}$ NMR-DEPT spectrum at $135^{\circ} \mathrm{CH}, \mathrm{CH}_{3}$ [positive (up)], $\mathrm{CH}_{2}$ [negative (down)], revealed the following signals at $\delta \mathrm{c}: 136.53(\mathrm{C}-4 \uparrow), 134.42(=\mathrm{CH} \uparrow), 129.35(=\mathrm{CH} \uparrow), 129.01$ (aromatic $\uparrow$ ), 128.57 (aromatic $\uparrow$ ), $125.88(\mathrm{C}-6 \uparrow), 125.57(\mathrm{C}-5 \uparrow), 121.78(\mathrm{C}-7 \uparrow), 120.20(\mathrm{C}-3$ $\uparrow$ ), $21.06\left(\mathrm{CH}_{3} \uparrow\right)$. In the DEPT spectrum at $90^{\circ}$ only CH signals are positive (up) and showed $\delta \mathrm{c}$ : $136.53(\mathrm{C}-4 \uparrow), 134.42(=\mathrm{CH} \uparrow), 129.35(=\mathrm{CH} \uparrow), 129.01$ (aromatic $\uparrow$ ), 128.57 (aromatic $\uparrow$ ), $125.88(\mathrm{C}-6 \uparrow), 125.57(\mathrm{C}-5 \uparrow), 121.78(\mathrm{C}-7 \uparrow), 120.20(\mathrm{C}-3 \uparrow)$. Method B. 8-Hydroxy-2-methylquinoline 1b $(0.01 \mathrm{mmol})$ and p-chlorobenzaldehyde ( 0.02 mmol ) were mixed thoroughly using mortar and put in an open vessel. Then the mixture was exposed to Microwave irradiation for 4 min . The oven was operated at $70 \%$ power ( 560 W ) in a two step mode with interval ( $2 \mathrm{~min}-30 \mathrm{~s}-2 \mathrm{~min}$ ). After the reaction, the mixture was allowed to cool down and $\mathrm{Et}_{2} \mathrm{O}(10 \mathrm{ml})$ was added. The crude product was filtered, washed with $\mathrm{Et}_{2} \mathrm{O}$ ( 15 ml ) and purified by recrystallization from ethanol to give 7 (m.p. and mixed m.p.) yield $40 \%$; (Lit. m.p. $150^{\circ} \mathrm{C}$ ) ${ }^{\mathrm{lf}, g}$

## General procedure for the preparation of 9-(4-chlorostyryl)-4H-pyrano[3,2-h]quinoline derivatives (8a,b and 9a,b)

A solution of (E) 2-(4-chlorostyryl)-8-hydroxyquinoline $7(0.01 \mathrm{mmol})$ in $\mathrm{EtOH}(30 \mathrm{ml})$ was treated with $\alpha$-cyano- $p$-chloro/bromocinnamonitrile $\mathbf{2 a}, \mathbf{b}(0.01 \mathrm{mmol})$ or ethyl $\alpha$-cyano- $p$ chloro/bromocinnamate $2 \mathbf{d}, \mathbf{e}(0.01 \mathrm{mmol})$ and piperidine $(0.5 \mathrm{ml})$. The reaction mixture was heated until complete precipitation occurred (reaction times: 15 min . for 2a,b and 30 min . for $\mathbf{2 d}, \mathbf{e})$. The solid product which formed was collected by filtration and recrystallised from benzene or ethanol to give $\mathbf{8 a , b}$ and $\mathbf{9 a}, \mathbf{b}$. The physical and spectral data of compounds $\mathbf{8 a}, \mathbf{b}$ and $\mathbf{9 a}, \mathbf{b}$ are as follows:
(E) 2-Amino-4-(4-chlorophenyl)-9-(4-chlorostyryl)-4H-pyrano[3,2-h]quinoline-3-carbonitrile (8a). (E) Ethyl 2-amino-4-(4-bromophenyl)-9-(4-chlorostyryl)-4H-pyrano[3,2-h]quinoline-3carboxylate (9b). Colourless needles, yield $81 \%$; m.p. 206-207 ${ }^{\circ} \mathrm{C}$; IR ( KBr ) $v\left(\mathrm{~cm}^{-1}\right): 3418$, $3297\left(\mathrm{NH}_{2}\right), 3050,3046,2985,2930(\mathrm{CH}), 1674(\mathrm{CO}) ;{ }^{1} \mathrm{H}$ NMR ( $\left.500 \mathrm{MHz}, \mathrm{DMSO}-d_{6}\right) \delta_{\mathrm{H}}: 9.61$ (bs, $2 \mathrm{H}, \mathrm{NH}_{2}$, cancelled by $\mathrm{D}_{2} \mathrm{O}$ ), 8.33-7.23 (m, 12 H , aromatic), $8.15(\mathrm{~d}, J=16 \mathrm{~Hz}, 1 \mathrm{H},=\mathrm{CH})$, $7.98(\mathrm{~d}, J=16 \mathrm{~Hz}, 1 \mathrm{H},=\mathrm{CH}), 5.09(\mathrm{~s}, 1 \mathrm{H}, \mathrm{H}-4), 4.01\left(\mathrm{q}, J=7 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 1.10(\mathrm{t}, J=7 \mathrm{~Hz}$, $3 \mathrm{H}, \mathrm{CH}_{3}$ ); ${ }^{13} \mathrm{C}$ NMR ( $\left.125 \mathrm{MHz}, \mathrm{DMSO}-d_{6}\right) \delta \mathrm{c}: 168.14$ (CO), 160.81 (C-2), 155.11 (C-9), 152.93 (C-10b), 142.77 (C-10a), 136.51 (C-7), $135.17(=\mathrm{CH}), 129.64(=\mathrm{CH}), 128.88$ (C-5), 127.72 (C$6 \mathrm{a}), 121.5$ (C-4a), $119.13(\mathrm{C}-6), 117.55(\mathrm{C}-8), 75.70(\mathrm{C}-3), 58.75\left(\mathrm{CH}_{2}\right), 40.09(\mathrm{C}-4), 14.27$ $\left(\mathrm{CH}_{3}\right), 147.14,138.12,133.30,132.92,131.13,129.12,128.97,124.95$ (aromatic); MS $m / z(\%)$ : $560[\mathrm{M}]^{+}$, (4), 406 (5), 280 (82), 225 (6), 101 (32), 75 (35), 62 (100) ; Anal. Calcd for $\mathrm{C}_{29} \mathrm{H}_{22} \mathrm{BrClN}_{2} \mathrm{O}_{3}$ : C, 61.99; H, 3.95; N, 4.99. Found: C, $62.02 ; \mathrm{H}, 4.00 ; \mathrm{N}, 5.03 \%$.

## Acknowledgements

This study was supported by the King Abdulaziz City for Science and Technology (KACST), No. A-S-11-0560.We also deeply thanks Mr. Ali Y. A. Alshahrani for making the ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR samples.
