Abstract
The syntheses of 1- and 7-hydroxypyrrolizidin-3-ones are described via asymmetric catalytic hydrogenation or diastereoselective reduction of ketones as key steps. 2,7-Disubstituted pyrrolizidin-3-ones are also prepared. The second chiral center is created using stereoselective electrophilic amination or hydroxylation reactions.

Keywords: Pyrrolizidinones, asymmetric synthesis, amination, hydroxylation, hydrogenation

Introduction

Functionalized bicyclic lactams with the nitrogen atom at the bridgehead position are interesting structures well studied in the literature. One commonly encountered function of this skeleton is in the formation of rigid dipeptide mimics. 1 Moreover, these bicyclic systems are known to be effective intermediates in the preparation of alkaloids such as the polyhydroxylated pyrrolizidines or indolizidines, 2-4 and of more complex structures like lepadiformine 5 or furopyrrrolizidinone. 6 The synthesis of pyrrolizidin-3-ones mono- or disubstituted at positions 1 or 7 was reviewed in 2000. 7
We have been interested in the preparation of such systems, in particular the (1R,7aS)- and (1S,7aS)-1-hydroxypyrrolizidin-3-ones (1 and 2) on one hand, and in a second line of study the O-protected (7S,7aS)- and (7R,7aS)-7-hydroxypyrrolizidin-3-ones (3 and 4) (Figure 1).

Figure 1. 1- and 7-Oxy-substituted pyrrolizidin-3-ones 1-4.
The preparations of the bicyclic lactams 1 and 2 and their enantiomers have been detailed in the literature.\textsuperscript{8-17} Most of the reported syntheses started from the amino acid proline or its derivatives, as these substrates have the advantage of introducing directly the stereocenter at C-7a of the ring system. The center at C-1 was controlled by asymmetric synthesis, by formation of a β-hydroxyester or amide and subsequent cyclisation under basic conditions, by aldol condensation or by reduction of pyrrolizidine-1,3-dione leading to 1 as a major product (90% d.e.). Other methods for the preparation of 2 have been described, such as the catalytic hydrogenation of 1,2-dihydro-1-hydroxypyrrolizin-3-one or pyrrolizine-1,3-dione. From all these preparations, the overall yields are quite often low due to multistep syntheses, with d.e. from 60 to 99% for 1, and up to 99% for 2.

Concerning the 7-hydroxypyrrolizidinones 3 and 4, few examples of synthesis are reported in the literature.\textsuperscript{4,18,19} In particular, the lactam 3 is described as an intermediate in the preparation of (−)-supidine,\textsuperscript{18} whereas its 7a-epimer led to 1-hydroxypyrrolizidine.\textsuperscript{4}

We present in this manuscript a new route to the bicyclic compounds 1 and 2 from L-proline and of 3 and 4 from L-pyroglutamic acid (PGA) based on diastereoselective reduction or catalytic hydrogenation.

Then we extended the pool to 2,7-difunctionalized pyrrolizidin-3-ones (Figure 2). In the literature, one example of the preparation of the protected dihydroxylated compound is reported, by tandem cycloaddition of nitroalkene.\textsuperscript{19b} In our approach, the chiral center at C-2 is created by electrophilic hydroxylation or amination reactions.

### Results and Discussion

We prepared the methyl β-ketoester 6 by the method of Masamune\textsuperscript{20} from the commercial N-Boc L-proline 5, in good yield (88%) without epimerization at chiral center (Scheme 1). The deprotection of the carbamate using trifluoroacetic acid (TFA) gave 7, which was purified and reduced using sodium borohydride (NaBH\textsubscript{4}). This reaction led to two separable diastereoisomers whose NMR spectra are in accord with the pyrrolizidinone structures 1 and 2, with predominance of the first. After 2 hours at 25 °C, with 1.2 mol\% of NaBH\textsubscript{4}, the compounds 1 and 2 were obtained in a 54/46 ratio and 81% yield. By decreasing the temperature to -10 °C and with a slow addition of 0.6 mol\% of NaBH\textsubscript{4}, we managed to upgrade the diastereoisomeric ratio to 85/15, although in lower yield (67%). The 1-hydroxypyrrolizidin-3-one 1 was isolated in 57%
yield from 7 after separation by chromatography over silica gel. The formation of the bicyclic compounds could proceed by reduction of the ketone and subsequent cyclisation. The formation of 1 would then be in agreement with a chelated transition state for the reduction step.

Scheme 1. Formation of the (1R,7aS)-1-hydroxypyrrolizidin-3-one 1.

The bicyclic compound 2 was obtained from the β-ketoester 6 following a similar way to that described by Genêt for the preparation of ent-2 from D-proline. We first performed a classical reduction of 6 with NaBH₄ to give the β-hydroxy-esters 8 and 9 in a 56/44 ratio and in 81% yield (Table 1, scheme 2). Physical separation of the two epimers by silica gel chromatography led to the two references for HPLC analysis. The hydrogenation of 6 run in the presence of [(R)-BinapRu]Br₂ as catalyst at 50 °C led to 8 in yields of up to 97% and d.e. of 96% depending on the pressure and reaction time. The use of [(S)-BinapRu]Br₂ as catalyst for the hydrogenation of 6 was not very efficient, the best ratio 8/9 being 16/84.

Scheme 2. Formation of the (1S,7aS)-1-hydroxypyrrolizidin-3-one 2.
After treatment of 8 with TFA, the intermediate pyrrolidine was treated with potassium carbonate to give the expected (1S)-hydroxypyrrolizidin-3-one 2 (94% for the 2 steps) (Scheme 2).

We reported few years ago the catalytic hydrogenation of β-ketoesters bearing a γ-lactam moiety. The full syntheses of 3 and 4 from commercial pyroglutamic acid 10 are detailed next. They began with the formation of the N-Boc protected 11 in three steps as described in the literature (Scheme 3). The homologation using Masamune's method led to the expected β-ketoester 12 in 67% yield after 4 days of reaction. In the earlier communication we reported the catalytic hydrogenation of 12 and showed that the best conditions for obtaining the β-hydroxyester 13 or its diastereoisomer 14 selectively was to use the catalyst under atmospheric pressure at 55 °C for 40 hours. We observed the removal of the tert-butoxycarbamate protecting group concomitantly with the hydrogenation reaction under these conditions. The β-hydroxyester with the 3S configuration (13) can be obtained in 94% diastereomeric excess and in nearly quantitative yield by using the [(R)-BinapRu]Br2 complex. The use of the (S)-catalyst led to the epimer 3R 14 as the sole isomer, also in good yield (89%).

The transformation of 13 and 14, respectively, into the epimeric pyrrolizidinones 3 and 4 was effected through the sequences described below (Scheme 4). After protection of the hydroxy functions as tert-butyldimethylsilyl ethers (15: 75%, 17: 88%), a first assay of the selective reduction of the methyl ester group with calcium borohydride formed in situ led to 16 and 18 in yields of 81 and 69% respectively. The yields were improved by reaction of 15 and 17 with a large excess of sodium borohydride (15 equiv.) in methanol, giving the same products 16 or 18 in yields of 94 and 77%. Their cyclisation was previously performed in a short sequence:
mesylation of the primary alcohol function, and cyclisation in the presence of potassium carbonate, leading to the pyrrolizidinones 3 and 4 in yields of around 60%.\textsuperscript{21} The yields have now been increased by the use of sodium hydride in tetrahydrofuran, becoming 84 and 85% respectively for the two-step sequence.

\textbf{Scheme 4.} Formation of the protected 7-hydroxypyrrrolizidin-3-ones 3 and 4.

We have shown access to the monohydroxylated pyrrolizidin-3-ones 1-4 in d.e. of up to 99%. For the two pyrrolizidinones 1 and 2 prepared in three and four steps respectively from 5, the diastereoselectivity is analogous to previously reported values, and is particularly remarkable for 2 (d.e. 96%, overall yield 80%) via a catalytic hydrogenation. Nevertheless, the very short synthesis described for compound 1 (d.e. 70%) via low temperature reduction made this a particularly interesting and inexpensive scheme despite the moderate overall yield (50%). Finally, the (7S,7aS)-7-(7r-butylidemethylsilyloxy)pyrrolizidin-3-one (3) and its epimer (7R,7aS)-4 were reached in nine steps from PGA (10) in overall yields of 30% and 27% respectively and excellent diastereoselectivities.

In a second project our aims were the 2,7-disubstituted derivatives 2,7-dihydroxyptpyrrolizidin-3-one and 2-amino-7-hydroxyptpyrrolizidin-3-one. The new functionality at position 2 was introduced at the beginning of the synthesis. We tested firstly the amination and hydroxylation reactions of PGA (10).

Beside the preparations of 3-amino γ-lactam described in the literature,\textsuperscript{23-25} there are very few instances of the direct amination α to the carbonyl of PGA. These last syntheses were based mainly on the reaction of the corresponding enolate with diphenylphosphoryl azide,\textsuperscript{24} or the hydrogenation of the oxime formed by the action of Bredereck’s reagent followed by nitrous acid treatment.\textsuperscript{25} In these two cases the relative configuration of the amino-PGA in the major product was always cis. We have developed a way of direct amination of protected PGA leading to the trans configuration in the product. The Boc-protected methyl pyroglutamate 19\textsuperscript{26} was treated with 1.1 equivalents of LiHMDS at -78 °C for 1 hour, followed by addition of 2.0 equivalents of dibenzyl azodiformate (DBAD) in tetrahydrofuran at -60 °C (scheme 5). After purification, the expected hydrazino derivative 20 was obtained in 66% yield, as only one diastereomer
The stereochemistry of the newly formed center of 20 was elucidated by conversion into the corresponding amine by a three-step sequence, namely, classical hydrogenation using Pd/C followed by the addition of Raney nickel in the reaction mixture, then by cleavage of the tert-butoxycarbonyl protecting group with TFA, leading to 21. The NMR spectral data of the product were in concordance with the structure of 21, and the trans configuration was proved by NOESY correlation studies. In particular, we found a strong effect between the protons H-4 and H-3b, and also between H-2, H-3a and NH₂. There is clearly no effect between H-2 and H-4. All these results are in agreement with the (R) configuration of the newly formed aminated stereocenter, showing that the enolate was attacked by the azodicarboxylate at its less hindered side only, leading to the one diastereoisomer. This result was particularly interesting in being the first example of direct amination of a protected PGA leading to the corresponding derivative with the trans configuration.

Scheme 5. Electrophilic amination and hydroxylation of protected PGA.

The electrophilic hydroxylation of the enolate of 22 by 3-phenyl-N-p-toluenesulfonyloxaziridine (TPO) has been first described by Nozoe and completed by Young. The reaction led to the hydroxylated 23 with a d.e. >99% but in low yield (30%). We increased this yield to 55% by the action of TPO at -78 °C over 45 minutes followed by hydrolysis in the presence of camphorsulfonic acid (CSA) (Scheme 5). The d.e. was as good as those of the earlier authors, as only the trans isomer was obtained (d.e. >95%, measured by NMR studies). The newly-formed hydroxyl function was protected as a tert-butyldimethylsilyl ether under classical conditions to give 24 (92%).

Thus, the 3-amino- and 3-hydroxy-APG have been prepared with excellent d.e. and in short preparative sequences. The fully-protected hydroxy compound 24 was used in the synthesis of 2,7-dihydroxypyrrolizidin-3-ones (Scheme 6).

To perform the synthesis of 2,7-dihydroxypyrrolizidin-3-ones, the carboxylic acid was first restored by hydrogenolysis of the benzyl ester of 24 and the subsequent homologation led to the
β-ketoester 25 (75% in two steps). The best results for the catalytic hydrogenation of the β-ketoester were obtained with the N- and O-free compound 27, from successive treatment of 25 with tetrabutylammonium fluoride giving 26, then trifluoroacetic acid. The hydrogenation of 27 was performed at 55 °C and atmospheric pressure in the presence of 2% mol of [(R)-BinapRu]Br₂ or [(S)-BinapRu]Br₂ catalyst. It gave the β-hydroxyesters 28 and 29 respectively with comparable diastereoselectivities and yields of 98% and 82%.

The diol 28 was transformed into the corresponding bicyclic system 31 in four steps (Scheme 7). Regioselective silylation of 28 using trisopropylsilyl chloride in a mixture DMF/imidazole led to the intermediate 3′-triisopropylsilyloxy compound. The methyl ester was then reduced by the action of an excess of NaBH₄, leading to 30. The primary alcohol was selectively tosylated and a cyclisation under basic conditions gave the pyrrolizidinone 31 with a yield of 43% for the 2 steps. The same sequence applied to 29 led to the compound 33 with a yield of 18% for the 4 steps.

A similar synthetic way is actually under progress for the obtaining of 2-amino-7-hydroxypyrrolizidin-3-one.

Finally, we tested the functionalization in α of the carbonyl of the pyrrolizidinones 1, 2, 3 and 4 in the way to increase our pool of disubstituted pyrrolizidin-3-ones. The functionalization of the derivatives 1, 2 and 3 by electrophilic amination or hydroxylation failed. Only 4 led to the hydrazine 34 (Scheme 8) with the yield of 63% using strong conditions: 5.0 equivalents of LDA, then the addition of a solution containing 4.0 equivalents of DTBAD at -60 °C. In term of diastereoselectivity for 34, NOESY correlation studies showed that the irradiation of the proton...
H-2 induced an effect at the proton H-7a, which is in favour of a cis relation. When the proton H-7 was irradiated, no effect with the H-2 was observed that confirmed a 2S absolute configuration of the new asymmetric aminated center.

**Scheme 7.** Formation of the 2,7-dihydroxypyrrolizidin-3-ones 31 and 33.

**Scheme 8.** Formation of 34.

**Conclusions**

In conclusion, we report the synthesis of seven mono- and di-substituted pyrrolizidin-3-ones from L-proline or L-pyroglutamic acid. Starting from L-proline, a very short synthetic sequence was developed to reach 1. Treatment of the β-ketoester derived from L-proline with sodium borohydride resulted in a one pot reduction/cyclisation. The hydroxypyrrolizidin-3-ones 2, 3 and 4 were obtained using asymmetric catalytic hydrogenation as the key step. 2,7-Disubstituted pyrrolizidin-3-ones were synthesized from L-pyroglutamic acid. The chiral centers were created at C-2 by electrophilic amination or hydroxylation and at C-7 by catalytic hydrogenation as before. The two stereomeric 2,7-dihydroxypyrrolizidin-3-ones 31 and 33 were prepared by this way. The N,O-diprotected 2-hydrazino-7-hydroxypyrrolizidin-3-one 34 was obtained by direct electrophilic amination of the corresponding 7-hydroxypyrrolizidin-3-one 4. Electrophilic amination of N-Boc PGA methyl ester was also performed, leading exclusively to
the 3-amino-PGA methyl ester 21 with a trans relative configuration, which should be an attractive building block for organic synthesis.

**Experimental Section**

**General.** Solvents were distilled according to *Purification of Laboratory Chemicals*, 4th Ed., W.L.F. Aramagro and D.D. Perrin, Butterworth Heinemann, 1996. The bis-(2-methylallyl)-cycloocta-1,5-diene-ruthenium(II) complex and (R)-2,2′-bis(diphenylphosphino)-1,1′-binaphthyl are from Acros. Organic layers were dried with MgSO₄ or Na₂SO₄. Flash chromatography was performed on silica gel chromagal 60 ACC 35-70 μm. Analytical TLC: aluminium-backed silica gel Merck 60 F₂₅₄. Optical rotations were measured at 25 °C on a Perkin-Elmer 241 polarimeter (1 dm cell). NMR spectra were recorded on a Brucker AC 200 or Avance 300 apparatus with chemical shift values (δ) in ppm downfield from tetramethylsilane. Microanalyses were performed by the Service de Masse de Masse of ICSN, Gif-sur-Yvette, France. HRMS were performed by the Service de Spectrométrie de Masse de Masse of ICSN, Gif-sur-Yvette, France.

**Methyl (2′S)-3-(N-tert-butoxycarbonyl-2′-pyrrolidinyl)-3-oxopropanoate (6).** Carbonyl-diimidazole (13.6 g, 84.0 mmol, 1.2 equiv.) was added to a solution of N-Boc-L-proline (5) (15.0 g, 69.8 mmol) in dry THF (560 mL). The reaction mixture was stirred at room temperature for 16 h. Magnesium salt of monomethylmalonate (10.9 g, 42.2 mmol, 0.6 equiv.) was added and the reaction mixture was stirred 5 days at room temperature. The solvents were evaporated and the residue was treated with an aqueous solution of HCl (2N) until pH 1. The aqueous layer was extracted with Et₂O (4 × 150 mL). The combined organic layers were dried, filtered and the solvents were evaporated. Purification by silica gel chromatography (Et₂O/pentane: 1/1) gave 6 as white crystals (16.6 g, 88%); [α]D₂⁵ -77 (c 1.3, DCM); ¹H NMR (200 MHz, CDCl₃): Ketoester: δ 1.42 (s, 9 H, OCM₂₄); 1.87-2.06 (m, 4 H, H-3′ and H-4′), 3.41-3.58 (m, 4 H, H-2 and H-5′), 3.73 (s, 3 H, OMe), 4.27 (m, 1 H, H-2′); Enol: δ 1.45 (s, 9 H, OCM₂₄); 1.87-2.06 (m, 4 H, H-3′ and H-4′), 3.41-3.58 (m, 2 H, H-5′), 3.76 (s, 3 H, OMe), 4.27 (m, 1 H, H-2′), 5.03 (m, 1 H, H-2); ¹³C NMR (50 MHz, CDCl₃), Ketoester + enol: δ 23.7, 24.4 (C-3′ or C-4′), 28.2, 28.3, 28.5 (OCM₂₄), 29.4, 29.7 (C-3′ or C-4′), 45.0, 46.1, 46.7 (C-2 and C-5′), 52.2, 52.3 (OMe), 65.0, 65.6 (C-2′), 80.2, 80.8 (OCM₂₄), 153.8 (CO), 167.4, 169.4 (C-1), 202.5 (C-3). Anal. Calcd for C₁₃H₂₁NO₅: C, 57.55; H, 7.80; N, 5.16. Found: C, 57.51; H, 7.54; N, 4.99.

**Methyl (2′S)-3-(2′-pyrrolidinyl)-3-oxopropanoate, trifluoroacetate salt (7).** TFA (1.5 mL) was added to 6 (200 mg) and the overall was stirred during 15 min. Concentration in vacuo led to the crude 7 (99%), which was too unstable for analysis and was directly introduced in the next reaction; ¹H NMR (200 MHz, CDCl₃): δ 2.05-2.11 (m, 3 H, H-3′ and H-4′), 2.48 (m, 1 H, H-3′ or H-4′), 3.43-3.52 (m, 2 H, H-2 or H-5′), 3.66-3.80 (m, 5 H, H-2 or H-5′ and OMe), 4.82 (m, 1 H, H-2′).
(1R,7aS)-1-Hydroxypyrrolizidin-3-one (1). To a solution of 7 (402 mg) in MeOH (8.8 mL) was added slowly NaBH₄ (56 mg, 0.6 equiv.) at -20 °C. The temperature is let warm until -10 °C for stirring 3 h. Then concentration and purification by silica gel chromatography (EtOAc/ MeOH: 9/1 then 3.5/1.5) gave 1 as a major compound (229 mg, 57%) and 2 (40 mg, 10%). NMR spectral data are in accordance with those in the literature.²²b

Methyl (3S,2'S)-3-(N-tert-butoxycarbonyl-2'-pyrrolidinyl)-3-hydroxypropanoate (8). The [(R)-BinapRu]Br₂ catalyst was prepared using the previously described procedure.²⁹ Under argon, to bis-(2-methylallyl)-cycloocta-1,5-diene-ruthenium(II) complex (0.02 equiv.) and (R)-2,2'-bis(diphenylphosphino)-1,1'-binaphthyl (0.02 equiv.) in degassed acetone (1 mL/mmol of catalyst) was added a methanolic solution of hydrogen bromide (0.15-0.18M, 0.04 equiv.). The reaction mixture was stirred one hour. The solvents were evaporated and the β-ketoester 6 (1 mmol) in freshly distilled degassed MeOH (1.7 mL) was cannulated to the catalyst. The reaction mixture was stirred at 100 bars and 50 °C during 48 h. The solvents were evaporated and purification by silica gel chromatography (DCM/ Et₂O/ MeOH: 100/30/4) gave 8 (yield 97%, d.e. 96%); [α]D~25° -63 (c0.1, CHCl₃); Lit²⁰: -62.69 (c4.17, CHCl₃, value for 8); ¹H NMR (200 MHz, CDCl₃): δ 1.47 (s, 9 H, OCMes), 1.58-1.93 (m, 4 H, H-3' and H-4'), 2.45-2.51 (m, 2 H, H-2), 3.33 (m, 1 H, H-5'), 3.43 (m, 1 H, H-5'), 3.71 (s, 3 H, OMe), 3.92-4.04 (m, 2 H, H-2' and H-3'); ¹³C NMR (50 MHz, CDCl₃): δ 24.0 (C-4'), 28.4 (C-3' and CMe₃), 40.4 (C-2), 47.3 (C-5'), 51.8 (OMe), 61.8 (C-2'), 72.0 (C-3), 80.5 (OCMe₃), 172.4 (C-1).

All mixtures of 8/9 were analysed by reverse phase HPLC: Kromasil C18-30°c, methanol / water 55:45; 1 mL/min; λ = 218 nm, P = 238 kg/cm²; Samples (10 mg) were prepared by passage through a cyanopropyl column (activated by MeOH (1 mL) and H₂O (1 mL)), washing with H₂O (1 mL), and elution with methanol/water 55:45 (1 mL); the resulting fraction was filtered over PVDF filter. 6: rt = 10.24 min; 8: rt = 12.72 min; 9: rt = 13.95 min.

(1S,7aS)-1-Hydroxypyrrolizidin-3-one (2). The compound 8 (155 mg, 0.6 mmol) was stirred at room temperature in the presence of TFA (3.2 mL) during 10 min. After evaporation of the solvent, the intermediate trifluoroacetate salt was introduced directly in the next step. A quick elution over silica gel chromatography (MeOH) led to the pure intermediate (153 mg, 94%); ¹H NMR (200 MHz, CDCl₃): δ 1.69 (m, 1 H, H-4'), 2.08 (m, 3 H, H-3' and H-4'), 2.57 (m, 2 H, H-2), 3.34 (m, 2 H, H-5'), 3.67 (m, 4 H, H-2' and OMe), 4.17 (m, 1 H, H-3), 6.85 (s, 1 H, OH), 8.68 (s, 1 H, NH); ¹³C NMR (50 MHz, CDCl₃): δ 24.2 (C-3'), 27.2 (C-4'), 39.1 (C-2), 45.1 (C-5'), 52.0 (OMe), 64.3 (C-2'), 67.9 (C-3), 171.5 (C-1).

The impure salt was retaken in water (1.5 mL) and K₂CO₃ (287 mg) was added. After stirring 3 h at 90 °C, the reaction mixture was concentrated and the crude was purified by silica gel chromatography (EtOAc/ MeOH: 85/15) to give 2 (161 mg, 94% from 8). NMR spectral data are in accordance with those in the literature.²²b

Methyl (2'S)-3-oxo-(N-tert-butoxycarbonyl-5'-oxypyrrolidin-2'-yl)propanoate (12). Magnesium chloride (920 mg, 9.8 mmol, 1.6 equiv.) was added to a solution of potassium monomethyl malonate (2.60 g, 16.5 mmol, 2.7 equiv.) in dry THF (38 mL). The reaction mixture was cooled at 0 °C, then triethylamine (2.6 mL, 18.3 mmol, 3.0 equiv.) was added and the whole
was stirred at this temperature for 80 min. In another flask, a solution of 11 (1.40 g, 6.1 mmol) in dry THF (8.4 mL) was added to carbonyldiimidazole (1.09 g, 6.7 mmol, 1.1 equiv.) in DMF (6.7 mL) and stirred for 40 minutes at room temperature. The second solution was then added to the salt at 0 °C, and the reaction mixture was warmed to room temperature then stirred for four days. After filtration, the filtrate was diluted with water (50 mL) and extracted with EtOAc (7 × 30 mL). The organic layers were washed with brine (50 mL), dried, then concentrated in vacuo to give a yellow oil. Purification by silica gel chromatography (EtOAc) gave 12 (1.17 g, 67%); [α]_D^{25} -12 (c0.4, MeOH); mp 91 °C; ¹H NMR (200 MHz, CDCl₃): δ 1.50 (s, 9 H, OCMes), 1.95-2.75 (m, 4 H, H-3′ and H-4′), 3.55 (d, 1 H, J 15.8 Hz, H-2), 3.66 (d, 1 H, J 16.0 Hz, H-2), 3.77 (s, 3 H, OMe), 4.81 (dd, 1 H, J 3.6; 9.3 Hz, H-5′); ¹³C NMR (75 MHz, CDCl₃): δ 20.0 (C-4′), 27.8 (OCM’es), 31.0 (C-3′), 46.1 (C-2), 52.6 (OMe), 63.8 (C-5′), 88.0 (OCM’es), 149.5 (CO), 166.8 (C-1), 173.0 (C-2′), 199.6 (C-3). Anal. Calc. for C₈H₁₉NO₆: Caled C 54.73, H 6.71, N 4.91; Found C 54.71, H 6.67, N 4.63.

**Methyl (2′S,3S)-3-Hydroxy-3-(5′-oxopyrrolidin-2′-yl)propanoate (13).** The protocol described for the preparation of 8 from 6, applied to 12 under hydrogen atmosphere at 55 °C during 40 h led to 13 after purification by silica gel chromatography (EtOAc/MeOH: 95/5) (yield 97%, d.e. 94%); [α]_D^{25} + 9 (c0.9; MeOH); mp 94 °C; ¹H NMR (300 MHz, CDCl₃): δ 1.77 (m, 1 H, H-4′), 2.18 (m, 1 H, H-4″), 2.35-2.58 (m, 4 H, H-2 and H-3′), 2.75 (broad s, 1 H, OH), 3.62 (dd, 1 H, J 7.1; 14.1 Hz, H-5′), 3.73 (s, 3 H, OMe), 3.86 (td, 1 H, J 3.2; 8.1 Hz, H-3), 6.76 (broad s, 1 H, NH); ¹³C NMR (75 MHz, CDCl₃): δ 23.4 (C-4′), 30.2 (C-3′), 37.6 (C-2′), 52.1 (OMe), 58.4 (C-5′), 71.7 (C-3), 172.4 (C-1), 178.3 (C-2′). Anal. Calc. for C₈H₁₉NO₆: Caled C 51.33, H 7.00, N 7.48; Found C 51.48, H 7.09, N 7.51.

**Methyl (2′S,3R)-3-Hydroxy-3-(5′-oxopyrrolidin-2′-yl)propanoate (14).** The protocol described for the preparation of 8 from 6, applied to 12 in the presence of [(S)-BinapRu]Br₂ under hydrogen atmosphere at 55 °C during 40 h led to 14 after purification by silica gel chromatography (EtOAc/MeOH: 95/5) (yield 89%, d.e. 99%); [α]_D^{25} + 5 (c1.0; MeOH); mp 129 °C; ¹H NMR (200 MHz, CDCl₃): δ 1.91-2.52 (m, 6 H, H-2, H-3′ and H-4′), 3.74-3.80 (m, 4 H, H-5′ and OMe), 4.05 (m, 1 H, H-3), 6.20 (broad s, 1 H, NH); ¹³C NMR (75 MHz, CDCl₃): δ 21.2 (C-4′), 29.8 (C-3′), 36.9 (C-2′), 52.0 (OMe), 58.1 (C-5′), 69.5 (C-3), 172.7 (C-1), 179.2 (C-2′). Anal. Calc. for C₈H₁₉NO₆: Caled C 51.33, H 7.00, N 7.48; Found C 51.49, H 7.12, N 7.39.

**Methyl (2′S,3S)-3-(tert-butyldimethylsilyloxy)-3-(5′-oxopyrrolidin-2′-yl)propanoate (15).** Under argon, a solution of imidazole (771 mg, 11.3 mmol, 2.6 eq.) in dry DMF (9.7 mL) was cannulated to a flask containing 13 (816 mg, 4.4 mmol). tert-butyldimethylsilyl chloride (1.18 g, 7.8 mmol, 1.8 eq.) was added and the reaction mixture was stirred at room temperature during 24 h. Water was then added (10 mL), and the compound was extracted with Et₂O (4 × 10 mL). The organic layers were dried and concentrated under vacuum to give a crude product which after purification by silica gel chromatography (EtOAc) gave 15 (988 mg, 75%); [α]_D^{25} -16 (c 0.5; MeOH); ¹H NMR (300 MHz, CDCl₃): δ 0.08 (s, 3 H, SiMe₂), 0.12 (s, 3 H, SiMe₂), 0.88 (s, 9 H, SiCMes), 1.80 (m, 1 H, H-4′), 2.16-2.55 (m, 5 H, H-2, H-3′ and H-4′), 3.70-3.76 (m, 4 H, H-5′ and OMe), 3.97 (dd, 1 H, J 5.7; 12.4 Hz, H-3), 5.66 (broad s, 1 H, NH); ¹³C NMR (75 MHz,
CDCl3: δ-5.1 (SiMe2), -4.6 (SiMe2), 17.9 (SiCMe3), 22.9 (C-4’), 25.7 (SiCMe3), 29.9 (C-3’), 38.9 (C-2), 51.8 (OMe), 58.2 (C-5’), 72.6 (C-3), 171.2 (C-1), 177.6 (C-2’). Anal. Calc. for C14H27NO3Si: Calcd C 55.78, H 9.03, N 4.65; Found C 55.49, H 9.03, N 4.75.

(2’S,3S)-3-(tert-Butyldimethylsilyloxy)-3-(5’-oxopyrrolidin-2’-yl)propanol (16). Sodium borohydride (1.83 g, 48.2 mmol, 15.0 equiv.) was added slowly to a solution of 15 (967 mg, 3.2 mmol) in dry MeOH (10 mL) at 0 °C under argon. After 2h 30m of stirring at room temperature, brine (2 mL) then an aqueous solution of NaCl 1N was added until neutral pH. The aqueous layer was extracted with EtOAc (3 × 5 mL). The organic layers were dried, concentrated for give a crude (824 mg, 94%); [α]25D +10 (c 1.0, DCM); mp 81 °C. 1H NMR (300 MHz, CDCl3): δ 0.10 (s, 3 H, SiMe2), 0.11 (s, 3 H, SiMe2), 0.91 (s, 9 H, SiCMe3), 1.65-1.87 (m, 3 H, H-3’ and H-2’), 2.12-2.44 (m, 4 H, H-4’, H-3’ and OH), 3.70-3.85 (m, 4 H, H-2’, H-3 and H-1); 6.19 (broad s, 1 H, NH); 13C NMR (75 MHz, CDCl3): δ-4.6 (SiMe2), -4.4 (SiMe2), 17.9 (SiCMe3), 23.3 (C-3’), 25.8 (SiCMe3), 30.2 (C-4’), 35.4 (C-2), 58.2 (C-2’), 58.3 (C-1), 73.8 (C-3), 178.0 (C-5’). Anal. Calc. for C13H27NO3Si: Calcd C 57.10, H 9.95, N 5.12; Found C 56.51, H 9.89, N 5.03.

(7S,7aS)-7-(tert-Butyldimethylsilyloxy)pyrrolizidin-3-one (3). To a solution of 16 (135 mg, 0.5 mmol) in dry DCM (3 mL) under argon was added methanesulfonyl chloride (132 µL, 1.7 mmol, 3.5 equiv.) then freshly distilled triethylamine (180 µL, 1.3 mmol, 2.6 equiv.). After stirring 12 hours, EtOAc (10 mL) was added and the organic layer was washed successively with distilled water (5 mL), a saturated aqueous solution of NaHCO3 (5 mL), then brine (5 mL). After drying, filtration and concentration under vacuo, the orange oil was retaken into anhydrous THF (9 mL) under argon and cooled at 0 °C. Sodium hydride (suspension in oil 60%, 40 mg, 1.0 mmol, 2.0 equiv.) was added to the reaction mixture and the overall was stirred at room temperature during 24 h. After hydrolysis with aqueous saturated NH4Cl until neutral pH, the aqueous layer was extracted with EtOAc (3 × 5 mL). The organic layers were dried, concentrated for give a crude which was purified by silica gel chromatography (EtOAc) to led to 3 (84%); [α]25D +33 (c 0.5, CHCl3) (Lit. 18 [α]25D +3 +33 (c 1.0, CHCl3)).

Methyl (2’S,3R)-3-(tert-Butyldimethylsilyloxy)-3-(5’-oxopyrrolidin-2’-yl)propanoate (17). The protocol described for the preparation of 15 from 13, applied to 14 led to 17 (88%); [α]25D +4 (c 0.6, MeOH); 1H NMR (200 MHz, CDCl3): δ 0.05(s, 3 H, SiMe2), 0.08 (s, 3 H, SiMe2), 0.86 (s, 9 H, SiCMe3), 1.83-2.56 (m, 6 H, H-2, H-3’ and H-4’), 3.68-3.78 (m, 4 H, H-5’ and OMe), 4.14 (m, 1 H, H-3), 6.11 (broad s, 1 H, NH); 13C NMR (75 MHz, CDCl3): δ-5.1 (SiMe2), -4.8 (SiMe2), 17.7 (SiCMe3), 20.7 (C-4’), 25.6 (SiCMe3), 29.9 (C-3’), 38.7 (C-2), 51.8 (OMe), 58.3 (C-5’), 70.9 (C-3), 171.3 (C-1), 178.7 (C-2’). Anal. Calc. for C14H27NO3Si: Calcd C 55.78, H 9.03, N 4.65; Found C 55.74, H 9.17, N 4.69.

(2’S,3R)-3-(tert-Butyldimethylsilyloxy)-3-(5’-oxopyrrolidin-2’-yl)propanol (18). The protocol described for the preparation of 16 from 15, applied to 17 led to 18 (77%) with recovery of 17 (15%); [α]25D +17 (c 0.5, DCM); 1H NMR (200 MHz, CDCl3): δ 0.07 (s, 3 H, SiMe2), 0.08 (s, 3 H, SiMe2), 0.88 (s, 9 H, SiCMe3), 1.72-2.51 (m, 7 H, H-4’, H-3’, H-2 and OH), 3.64-3.82 (m, 4 H,
H-2', H-3 and H-1), 6.95 (broad s, 1 H, NH); 13C NMR (75 MHz, CDCl3): δ 4.6 (SiMe2), 17.9 (SiCMe3), 22.2 (C-3'), 25.7 (SiCMe3), 30.1 (C-4'), 36.1 (C-2), 58.3 (C-2'), 58.6 (C-1), 72.4 (C-3), 179.1 (C-5'). Anal. Calc. for C13H27NO3Si: Calcd C 57.10, H 9.95, N 5.12; Found C 56.58, H 10.17, N 5.11.

(7R,7aS)-7-(tert-Butyldimethylsilyloxy)pyrrolizidin-3-one (4). The protocol described for the preparation of 3 from 16, applied to 18 led to 4 (85%); [α]D25^25 -37 (c0.4, CHCl3) (Lit. [α]D25 +38 (c0.9, CHCl3) for ent-4); 1H NMR (300 MHz, CDCl3): δ 0.04 (s, 6 H, SiMe2), 0.87 (s, 9 H, SiCMe3), 1.74 (m, 1 H, H-1), 1.93 (m, 1 H, H-6), 2.14-2.42 (m, 3 H, H-1, H-2 and H-6), 2.66 (m, 1 H, H-2), 3.17 (m, 1 H, H-5), 3.58 (m, 1 H, H-5), 3.69 (dd, 1 H, J 6.9; 13.9 Hz, H-7a), 3.81 (dd, 1 H, J 6.9; 13.7 Hz, H-7); 13C NMR (75 MHz, CDCl3): δ -4.8 (SiMe2), -4.7 (SiMe2), -17.9 (SiCMe3), 25.1 (C-1), 25.6 (SiCMe3), 34.3 (C-2), 35.7 (C-6), 39.8 (C-5), 67.4 (C-7), 76.6 (C-7), 178.1 (C-3); ESI-HMRS: m/z calcd for C13H25NO3Si [M+Na]^+: 278.1552; found: 278.1556.

Methyl (2S,4R)-1-tert-butoxycarbonyl-4-[N,N-di(benzyloxy carbonyl)hydrazino]-5-oxopyrrolidine-2-carboxylate (20). A solution of LiHMDS (1 M in THF, 1.4 mL, 1.1 equiv.) in THF (8.5 mL) was added slowly to a solution of 19^26 (320 mg, 1.3 mmol) in THF (6.8 mL) at -78 °C under argon. After stirring 1 hour, a solution of DBAD (790 mg, 2.6 mmol, 2.0 equiv.) in THF (2.6 mL) was added. The overall was stirred 4 hours at this temperature, then was quenched with saturated aqueous NH4Cl (20 mL). The aqueous layer was extracted with DCM (4 × 10 mL), dried and concentrated to give 1.2 g of yellow oil. Purification by silica gel chromatography (Et2O/pentane: 1/1) gave 20 (468 mg, 66 %, d.e.>95%), which was too unstable to give correct elemental analysis; 1H NMR (200 MHz, CDCl3): δ 1.49 (s, 9 H, OCMe3), 1.68 (m, 1 H, H-3), 2.46 (m, 1 H, H-3), 3.79 (s, 3 H, OMe), 4.58 (m, 1 H, H-4), 5.11-5.18 (m, 5 H, H-2 and CH2Ph), 6.84 (s, 1 H, NH), 7.31 (m, 10 H, Ar); 13C NMR (75 MHz, CDCl3): δ 25.5 (C-3) 27.9 (OCMe3), 31.0 (C-2), 52.9 (OMe), 55.7 (C-4), 68.1 (CH2Ph), 68.8 (CH2Ph), 84.4 (OCMe3), 127.8-135.3 (Ar), 149.0 (CO), 155.3 (CO), 171.2 (CO).

Methyl (2S,4R)-4-Amino-5-oxopyrrolidine-2-carboxylate, trifluoroacetate salt (21). To the derivative 20 (1.7 g, 3.1 mmol) dissolved in MeOH (40 mL), was added Pd/C (88 mg). The overall was stirred vigorously under an atmospheric pressure of dihydrogen for 2 hours. Then Raney nickel was added, and the overall was stirred until the disappearance of the intermediate hydrazine (12 hours). The reaction mixture was passed through celite and washed with MeOH for give crude (518 mg) as yellow-green crystals. Purification under flash chromatography (EtOAc) gave two products, corresponding to the 1N-Boc and the 3N-Boc derivatives of 20 (64%). Each one was treated as follows, to give the same final derivative 21: they were retaken into TFA (0.85 mL for 80 mg of substrate), and after stirring 10 min the mixture was concentrated to give yellow and very hygroscopic crystals of 21 (86%; 55% from 20); [α]D25^25 -40 (c1.6, MeOH); 1H NMR (200 MHz, CD3OD): δ 2.45 (m, 1 H, H-3), 2.73 (m, 1 H, H-3), 3.77 (s, 3 H, OMe), 4.09 (dd, 1 H, J 10.2; 8.7 Hz, H-4), 4.36 (dd, 1 H, J 9.3; 1.1, H-2), 5.34 (s, 3 H, NH); 13C NMR (75 MHz, CD3OD) (major rotamer): δ 30.8 (C-3), 50.2 (C-2), 53.3 (OMe), 54.1 (C-4), 117.7 (CF3CO2), 160.2 (CF3CO2), 173.4 (CO), 173.6 (CO). Anal. Calc. for C8H11F3N2O5: Calcd C 35.30, H 4.07, N 10.29; Found C 35.52, H 4.29, N 9.26.
Benzyl (2S,4R)-1-tert-butoxycarbonyl-4-hydroxy-5-oxopyrrolidine-2-carboxylate (23). To a solution of 22 (5.1 g, 16.0 mmol) in anhydrous THF (87 mL) under argon at -78 °C, was added a solution of LiHMDS (1 M in THF, 16.0 mL, 16.0 mmol, 1.0 equiv.) in anhydrous THF (92 mL). After stirring 1 h, a solution of N-p-toluenesulfonyl-3-phenyloxaziridine (TPO) (6.6 g, 24.0 mmol, 1.5 equiv.) in anhydrous THF (87 mL) was added. After an additional 45 min, the reaction mixture was quenched with a solution of CSA (0.5 M in THF, 5.0 equiv.) and let warm to room temperature. Then water (500 mL) was added, and the crude was extracted with DCM (5 × 250 mL). The organic layers were successively washed with a solution of saturated sodium thiosulfate (500 mL), then brine (500 mL), and then dried and concentrated to give a crude material which was purified by silica gel chromatography (Et2O) to give 23 (55%); [α]23° +15 (c 0.4, DCM); mp 98 °C; 1H NMR (300 MHz, CDCl3): δ 1.44 (s, 9 H, OMe), 2.22 (m, 1 H, H-3), 2.51 (m, 1 H, H-3), 4.43 (dd, 1 H, J 12.5-12.8; 16.1-16.5 Hz, H-4), 4.66 (dd, 1 H, J 1.3-1.6; 14.5-14.8 Hz, H-2), 5.22 (s, 2 H, CH2Ph), 7.37 (s, 5 H, Ar); 13C NMR (75 MHz, CDCl3): δ 27.6 (OCMe), 30.6 (C-3), 55.5 (C-2), 67.5 (CH2Ph), 68.4 (C-4), 84.2 (OCMe3), 128.5, 128.6, 134.8 (Ar), 148.7 (CO), 170.5, 174.8 (C-5 and CO2Bn); Anal. Calcd for C17H21NO6: C, 60.89; H, 6.31; N, 4.18. Found: C, 60.83; H, 6.43; N, 4.18.

Benzyl (2S,4R)-1-tert-butoxycarbonyl-4-tert-butyldimethylsilyloxy-5-oxopyrrolidine-2-carboxylate (24). To a solution of 23 (2.9 g, 8.7 mmol) in DMF (85 mL) under argon, was added imidazole (3.5 g, 51.9 mmol, 6.0 equiv.) then tert-butyldimethylsilyl chloride (4.2 g, 27.7 mmol, 3.2 equiv.). The overall was warmed at 70 °C during 3.5 h, then water (85 mL) was added at room temperature. The aqueous layer was extracted with Et2O (4 × 90 mL), and the organic layers were dried and concentrated. A purification by silica gel chromatography (Et2O/pentane: 1/2) gave 24 (3.6 g, 92%); [α]23° +13 (c 1.5, DCM); 1H NMR (300 MHz, CDCl3): δ 0.10 (s, 3 H, SiMe2), 0.16 (s, 3 H, SiMe2), 0.88 (s, 9 H, SiMe3), 1.45 (s, 9 H, OMe), 2.19 (dt, 1 H, J 9.9; 13.1 Hz, H-3), 2.34 (ddd, 1 H, J 1.5; 8.3; 13.1 Hz, H-3), 4.38 (dd, 1 H, J 8.3; 10.2 Hz, H-4), 4.61 (dd, 1 H, J 1.5; 9.6 Hz, H-2), 5.22 (s, 2 H, CH2Ph), 7.37 (s, 5 H, Ar); 13C NMR (75 MHz, CDCl3): δ -5.4 (SiMe2), -4.5 (SiMe2), 18.2 (SiMe3), 25.6 (SiMe3), 28.0 (OCMe3), 55.1 (C-2), 67.4 (CH2Ph), 69.6 (C-4), 83.9 (OCMe3), 128.5, 128.7, 135.0 (Ar), 149.4 (CO), 171.0, 172.0 (C-5 and CO2Bn); Anal. Calcd for C23H35NO6Si: C, 61.44; H, 7.85; N, 3.12. Found: C, 61.41; H, 7.99; N, 3.11.

Methyl (2′R,4′S)-3-[N-tert-butoxycarbonyl-4′-(tert-butyldimethylsilyloxy)-5′-oxopyrrolidin-2′-yl]-3-oxopropanoate (25). The hydrogenolysis of a solution of 24 (3.6 g, 8.0 mmol) in EtOAc (5 mL) in the presence of Pd/C (10%) at 10 bars during 1 h led to the intermediate carboxylic acid after filtration through celite and concentration (2.8 g, 98%); 1H NMR (300 MHz, CDCl3): δ 0.14 (s, 3 H, Me), 0.18 (s, 3 H, Me), 0.91 (s, 9 H, Me), 1.52 (s, 9 H, OMe), 2.25 (m, 1 H, H-4), 2.48 (m, 1 H, H-4), 3.85 (broad s, 1 H, COOH), 4.45 (dd, 1 H, J = 8.3; 10.0 Hz, H-3), 4.63 (d, 1 H, J = 9.6 Hz, H-5); 13C NMR (75 MHz, CDCl3): δ -5.3 (SiMe2), -4.5 (SiMe2), 18.2 (SiMe3), 25.6 (SiMe3), 28.0 (OCMe3), 31.7 (C-4), 54.8 (C-5), 69.7 (C-3), 84.3 (OCMe3), 149.7 (CO), 171.9 (C-2), 176.1 (CO2H).
Under argon, carbonyldiimidazole (1.5 g, 9.3 mmol, 1.2 equiv.) was added to a solution of the acid (2.8 mg, 7.8 mmol) in dry THF (64 mL) and the mixture was stirred 16 h at room temperature. In another flask, to a solution of potassium monomethyl malonate (4.3 g, 27.3 mmol, 3.5 equiv.) in dry THF (33 mL) at 5 °C was added triethylamine (5.0 mL, 35.9 mmol, 4.6 equiv.) and magnesium chloride (3.1 g, 33.5 mmol, 4.3 equiv.). The overall was stirred at room temperature during 3 h then cooled again at 0 °C before the addition of the acylimidazolide previously prepared. The reaction mixture was let warmed to room temperature then stirred during 4 days. THF was evaporated and the residue was dissolved in aqueous 1M HCl until pH 5-6. After extraction with DCM (5 × 300 mL), the organic layers were dried and concentrated. A purification by silica gel chromatography (Et2O/pentane: 1:1) gave 25 (2.5 g, 76%); [α]D +42 (c0.5, DCM); mp 65 °C; 1H NMR (200 MHz, CDCl3): δ 0.13 (s, 3 H, SiMe2), 0.18 (s, 3 H, SiMe2), 0.90 (s, 9 H, SiMe3), 1.51 (s, 9 H, OMe), 2.15 (dt, 1 H, J 9.8; 13.3 Hz, H-4′), 2.38 (ddd, 1 H, J 1.9; 8.3; 13.3 Hz, H-4′), 3.57 (d, 1 H, J 16.0 Hz, H-2), 3.71 (d, 1 H, J 16.0 Hz, H-2), 3.78 (s, 3 H, OMe), 4.41 (dd, 1 H, J 8.3; 9.8 Hz, H-3′), 4.79 (dd, 1 H, J 1.8; 9.9 Hz, H-5′); 13C NMR (75 MHz, CDCl3): δ -5.3 (SiMe2), -4.5 (SiMe2), 18.2 (SiMe3), 25.7 (SiMe3), 27.9 (OMe), 30.4 (C-4′), 46.7 (C-2), 52.6 (OMe), 60.0 (C-5′), 69.5 (C-3′), 84.2 (OMe), 149.9 (CO), 166.9 (C-1), 171.7 (C-2′), 200.2 (C-3). Anal. Calc. for C19H33NO7Si: Calcd C 54.92, H 7.0, N 3.26; ESI-HRMS: m/z calcd for C19H33NO7NaSi [M+Na]⁺: 438.1924; found: 438.1917.

Methyl (2′,4′S)-3-[(N-tert-butoxycarbonyl-4′-hydroxy-5′-oxopyrrolidin-2′-yl)-3-oxopropanoate (26). Under argon, TBAF (1M in THF, 0.9 mL, 0.9 mmol, 1.5 equiv.) was added to a solution of 25 (263 mg, 0.6 mmol) in dry THF (22.5 mL). After stirring 2.5 h, brine (22 mL) was added and the aqueous layer was extracted with EtOAc (5 × 45 mL). The organic layers were dried, concentrated and purified by silica gel chromatography (EtOAc) to give 26 (174 mg, 91%); [α]D +27 (c1.6, DCM); mp 93 °C; 1H NMR (200 MHz, CDCl3): δ 1.52 (s, 9 H, OMe), 2.22 (m, 1 H, H-4′), 2.53 (dd, 1 H, J 8.2-8.6; 13.1-13.5 Hz, H-4′), 3.58 (d, 1 H, J 16.0 Hz, H-2), 3.71 (d, 1 H, J 16.0 Hz, H-2), 3.78 (s, 3 H, OMe), 4.41 (m, 1 H, H-3′), 4.86 (dd, 1 H, J 10.0 Hz, H-5′); 13C NMR (75 MHz, CDCl3): δ 27.7 (OMe), 28.9 (C-4′), 46.4 (C-2), 52.6 (OMe), 60.5 (C-5′), 68.4 (C-3′), 84.5 (Ome), 149.0 (CO), 166.7 (C-1), 173.9 (C-2′), 199.4 (C-3). Anal. Calc. for C13H19NO3: Calcd C 58.47, H 6.9, N 4.65; Found C 58.4, H 6.9, N 4.6.

Methyl (2′R,4′S)-3-(4′-hydroxy-5′-oxopyrrolidin-2′-yl)-3-oxopropanoate (27). To a solution of 26 in DCM (5 mL) under argon at 0 °C was added TFA (5 mL). After 10 min of stirring at room temperature, solvents were co-evaporated with toluene. Purification by silica gel chromatography (DCM/MeOH: 95:5) gave 27 (110 mg, 95%); 1H NMR (200 MHz, CD3OD): δ 2.24 (m, 1 H, H-4′), 2.53 (m, 1 H, H-4′), 3.69-3.74 (m, 5 H, H-2 and OMe), 4.35 (t, 1 H, J 7.9-8.3 Hz, H-3′), 4.44 (dd, 1 H, J 2.4-2.6; 9.4-9.7 Hz, H-5′), 4.84 (bd, 2 H, NH and OH); 13C NMR (50 MHz, CD3OD): δ 33.9 (C-4′), 36.2 (C-2), 52.8 (OMe), 60.0 (C-5′), 68.9 (C-3′), 169.2 (C-1), 179.8 (C-2′), 203.4 (C-3).

Methyl (2′R,3S,4′S)-3-hydroxy-3-(4′-hydroxy-5′-oxopyrrolidin-2′-yl)propanoate (28). The protocol described for the preparation of 8 from 6, applied to 27 in the presence of [(R)-
BinapRu]Br$_2$ at atmospheric pressure and 55 °C during 24 h led to 28 after purification by silica gel chromatography (DCM/MeOH: 9/1) (yield 98%, d.e. 88%); $^1$H NMR (300 MHz, CD$_3$OD): $\delta$ 2.07 (dt, 1 H, J 8.3; 13.3 Hz, H-4'), 2.33 (ddd, 1 H, J 2.3; 8.3; 13.3 Hz, H-4'), 2.41-2.57 (m, 2 H, H-2), 3.64 (ddd, 1 H, J 2.3; 3.8; 8.7 Hz, H-5'), 3.69 (s, 3 H, OMe), 3.96 (q, 1 H, J 4.1-4.5 Hz, H-3), 4.39 (t, 1 H, J 8.0 Hz, H-3'), 4.85 (broad s, 3 H, NH and OH); $^{13}$C NMR (75 MHz, CD$_3$OD): $\delta$ 35.2 (C-4'), 39.7 (C-2), 52.2 (OMe), 56.8 (C-5'), 69.8 (C-3'), 71.5 (C-3), 173.4 (C-1), 180.2 (C-2').

**Methyl (2'R,3'R,4'S)-3-hydroxy-3-(4'-hydroxy-5'-oxopyrrolidin-2'-yl)propanoate (29).** The protocol described for the preparation of 8 from 6, applied to 27 in the presence of [(S)-BinapRu]Br$_2$ at atmospheric pressure and 55 °C during 88 h led to 29 after purification by silica gel chromatography (DCM/MeOH: 9/1) (yield 82%, d.e. 86%); $[\alpha]_D^{25}$ +10 (c 0.4, MeOH); $^1$H NMR (300 MHz, CD$_3$OD): $\delta$ 1.94 (dt, 1 H, J 8.3; 13.3 Hz, H-4'), 2.37-2.56 (m, 3 H, H-2 and H-4'), 3.58 (ddd, 1 H, J 2.1; 3.8; 8.7 Hz, H-5'), 3.69 (s, 3 H, OMe), 4.00 (q, 1 H, J 4.0-4.4 Hz, H-3), 4.37 (t, 1 H, J 8.1 Hz, H-3'), 4.86 (broad s, 3 H, NH and OH); $^{13}$C NMR (75 MHz, CD$_3$OD): $\delta$ 32.2 (C-4'), 39.7 (C-2), 52.2 (OMe), 56.8 (C-5'), 69.9 (C-3'), 70.7 (C-3), 173.4 (C-1), 179.9 (C-2'). Anal. Calc. for C$_8$H$_{13}$NO$_5$: Calc'd C 47.29, H 6.45, N 6.89; Found C 47.04, H 6.26, N 6.74.

**{(1S,2'S,4'R)-1-[5'-Oxo-4'-triisopropylsilyloxy]pyrrolidin-2'-yl}propane-1,3-diol (30).** Under argon, imidazole (145 mg, 2.1 mmol, 2.6 equiv.) and triisopropylsilyl chloride (158 mg, 0.8 mmol, 1.0 equiv.) were added to a solution of 28 (167 mg, 0.8 mmol) in dry DMF (1.3 mL). After 1.5 h of stirring, water (5 mL) was added and the aqueous layer was extracted with Et$_2$O (5 × 5 mL). The organic layers were dried, concentrated and the crude product was purified by silica gel chromatography (EtOAc) to give the intermediate 3'-triisopropylsilyl ether which was retaken in methanol (1.9 mL) under argon at 0 °C. Sodium borohydride (356 mg, 9.4 mmol, 15.0 equiv.) was added slowly, and the reaction mixture was stirred at room temperature during 1 h. Aqueous HCl 1M was added for reach neutral pH, and the aqueous layer was extracted with DCM (5 × 10 mL). The organic layers were dried and concentrated in vacuo. The crude was purified by silica gel chromatography (DCM/MeOH: 9/1) to give 30 (176 mg; 65% for the two steps); $^1$H NMR (200 MHz, CD$_3$OD): $\delta$ 1.11-1.12 (m, 21 H, Si(Pr)$_3$), 1.58-1.69 (m, 2 H, H-2), 2.07 (m, 1 H, H-3'), 2.32 (m, 1 H, H-3'), 3.55-3.73 (m, 4 H, H-2', H-1 and H-3), 4.60 (t, 1 H, J 7.2-7.5 Hz, H-4'), 4.87 (broad s, 2 H, NH and OH); $^{13}$C NMR (75 MHz, CD$_3$OD): $\delta$ 13.4 (Si(CHMe$_2$)$_3$), 18.4 (Si(CHMe$_2$)$_3$), 36.9 (C-3'), 37.1 (C-2), 57.3, 59.7 (C-2' and C-3), 71.6, 72.1 (C-4' and C-1), 179.0 (C-5').

**{(2R,7S,7aS)-7-Hydroxy-2-(triisopropylsilyloxy)pyrroloizidin-3-one (31).** $p$-Toluenesulfonyl chloride (21 mg, 0.1 mmol, 1.2 equiv.) was added to a solution of 30 (30 mg, 0.09 mmol) in a mixture DCM/Pyr. (2/1, 0.3 mL) under argon at 0 °C. After 16 h stirring at room temperature, the reaction mixture was poured in ice and NaHCO$_3$ was added until neutral pH. The overall was extracted with DCM (4 × 2 mL), the organic layers were dried and concentrated to give a residue which was retaken in dry THF (0.5 mL) under argon. Potassium tert-butoxide (10 mg, 0.09 mmol, 1.0 equiv.) was added and the reaction mixture was stirred 10 min. After addition of brine
extraction with DCM (4 × 2 mL), drying of the organic layers, the crude was purified by silica gel chromatography to give 31 (12 mg, 43%); [α]$_D$$^2$$^\circ$ +2 (c 0.5, CHCl$_3$); $^1$H NMR (300 MHz, CDCl$_3$): δ 1.07-1.10 (m, 21 H, SiPr$_3$), 1.88-2.48 (m, 4 H, H-1 and H-6), 3.17 (m, 1 H, H-5), 3.61 (m, 1 H, H-5), 3.97 (m, 1 H, H-7a), 4.11 (t, 1 H, J 3.3 Hz, H-7), 4.46 (dd, 1 H, J 2.5; 7.3 Hz, H-2); $^{13}$C NMR (75 MHz, CDCl$_3$): δ 12.1 (Si(CHMe$_3$)$_2$), 17.8, 17.9 (Si(CHMe$_2$)$_3$), 30.1 (C-1), 36.2 (C-6), 39.3 (C-5), 64.3 (C-7a), 69.3 (C-7), 75.7 (C-2), 174.9 (C-3); ESI-HMR: m/z calcd for C$_{16}$H$_{31}$NO$_3$NaSi [M+Na]$^+$: 336.1971; found: 336.1969.

(1R,2'S,4'R)-1-[5'-Ox0-4'-(triisopropylsilyloxy)pyrrolidin-2'-yl]propane-1,3-diol (32). The protocol described for the preparation of 30 from 28, applied to 32 (91%); $^1$H NMR (200 MHz, CD$_3$OD): δ 1.10-1.12 (m, 21 H, SiPr$_3$), 1.49-1.65 (m, 2 H, H-2), 1.99 (m, 1 H, H-3'), 2.44 (m, 1 H, H-3'), 3.52-3.74 (m, 4 H, H-2', H-1 and H-3), 4.57 (t, 1 H, J 7.5-7.7 Hz, H-4'), 4.86 (broad s, 2 H, NH and OH).

(2R,7R,7aS)-7-Hydroxy-2-(triisopropylsilyloxy)pyrrolizidin-3-one (33). The protocol described for the preparation of 31 from 30, applied to 32 led to 33 (20%); [α]$_D$$^2$$^\circ$ -22 (c 0.4, CHCl$_3$); $^1$H NMR (300 MHz, CDCl$_3$): δ 1.08-1.09 (m, 21 H, SiPr$_3$), 1.69 (broad s, 1 H, OH), 1.84-2.33 (m, 4 H, H-1 and H-6), 3.28 (m, 1 H, H-5), 3.62 (m, 1 H, H-5), 3.84-4.00 (m, 2 H, H-7 and H-7a), 4.40 (dd, 1 H, J 1.1-1.3; 5.9-6.1 Hz, H-2); $^{13}$C NMR (75 MHz, CDCl$_3$): δ 12.1 (Si(CHMe$_3$)$_2$), 17.8, 17.9 (Si(CHMe$_2$)$_3$), 35.6, 36.9 (C-1 and C-6), 40.0 (C-5), 65.5 (C-7a), 75.9 (C-2), 76.0 (C-7), 173.7 (C-3); ESI-HMR: m/z calcd for C$_{16}$H$_{31}$NO$_3$NaSi [M+Na]$^+$: 336.1971; found: 336.1977.

(2S,7R,7aS)-7-(tert-Butyldimethylsilyloxy)-2-[N,N'-di-(tert-butoxycarbonyl)hydrazino]pyrrolizidin-3-one (34). A solution of LDA was prepared under argon by adding slowly at -40 °C a solution of nBuLi 1.6M in pentane (630 µL, 1.0 mmol, 5.2 equiv.) in a flask containing freshly distilled diisopropylamine (138 µL, 1.0 mmol, 5.0 equiv.) in dry THF (1.4 mL), then stirring at this temperature 45 min. The base was then transferred slowly over a flask containing the bicyclic compound 4 (50 mg, 0.2 mmol) in THF (0.3 mL) at -60°C. After 3 hour of stirring, a solution of DTBAD (180 mg, 0.8 mmol, 4.0 equiv.) in THF (0.6 mL) was added. After one hour, the reaction mixture was quenched with aqueous saturated NH$_4$Cl (10 mL), extracted with DCM (4 × 5 mL). The organic layers were washed with brine (5 mL), dried and concentrated under vacuo to give yellow oil. A purification by silica gel chromatography (EtOAc/pentane: 1/2) gave 34 (60 mg, 63%); [α]$_D$$^2$$^\circ$ -16 (c 2.4, DCM); $^1$H NMR (200 MHz, CDCl$_3$): δ 0.06 (s, 6 H, SiMe$_2$), 0.88 (s, 9 H, SiMe$_3$), 1.46 (s, 9 H, OCMe$_3$), 1.51 (s, 9 H, OCMe$_3$), 1.70-1.88 (m, 2 H, H-1), 1.97 (m, 1 H, H-6), 2.19 (m, 1 H, H-6), 2.65 (m, 1 H, H-2), 3.25 (m, 1 H, H-5), 3.50 (m, 1 H, H-7a), 3.62 (m, 1 H, H-5), 3.84 (m, 1 H, H-7), 6.48 (s, 1 H, NH); $^{13}$C NMR (75 MHz, CDCl$_3$): δ -4.8 (SiMe$_2$), -4.7 (SiMe$_2$), 17.9, 18.0 (CMe$_3$), 25.7, 28.1, 28.2, 29.7 (CMe$_3$), 29.7 (C-1), 34.8 (C-6), 35.3 (C-2), 40.2 (C-5), 63.1 (C-7 or C-7a), 65.1 (C-7 or C-7a), 81.2 (CMe$_3$), 154.4 (CO), 155.6 (CO), 170.4 (C-3); ESI-HMR: m/z calcd for C$_{25}$H$_{43}$N$_3$O$_6$NaSi [M+Na]$^+$: 508.2819; found: 508.2810.
Acknowledgements

We thank Vanessa Razafimahaleo for the preparation of pyrrolizidinone 3 in the gram scale.
