General Methods. Acetonitrile, chloroform were distilled from calcium hydride immediately prior to use. DMF, toluene, nitromethane were distilled before use. All aniline derivatives, Bi(OTf)$_3$, methyl pyruvate are commercially available. Compounds 3a,$^{16}$ 3n, 3o, 3i and 3c$^{17}$ previously reported in the literature. Column chromatography was performed using MN silica gel (particle size 0.040-0.063 mm). For thin-layer chromatography (TLC), silica gel coated aluminium plates (Merck, silica gel 60 F$_{254}$) were used and chromatography was performed using silica gel Merck 60 (particle size 0.063-0.20 mm), visualised by UV irradiation. $^1$H-NMR and $^{13}$C-NMR were recorded on a Mercury 300 or 400 spectrometer in CDCl$_3$ or MeOD. Data are reported in the following order: chemical shift (δ) in ppm; multiplicities are indicated bs (broadened singlet), s (singlet), d (doublet), m (multiplet), dd (double doubled); coupling constants (J) are in Hertz (Hz). $^{13}$C NMR spectra were acquired on a broad band decoupled mode. Mass spectra was conducted on GC-MS Shimadzu QP2010 (column: Equity®,5, length × I.D. 30 m × 0.25 mm, df 0.25 μm, lot # 28089-U, Supelco). HRMS were measured on a Finnigan MAT 95 or LTQ Orbitrap XL spectrometer. IR spectra were measured in a Perkin-Elmer ATR apparatus and are reported in terms of frequency of absorption (cm$^{-1}$). Microwave, CEM marked, Discover SP-D With explorer 12 Hybrid was used.

General procedure for the synthesis of 1,2-dihydroquinolines under room temperature

The N-Substituted aniline (100 mg, 1 eq) was dissolved in acetonitrile (1.5 ml) in a screw-capped test tube and Bi(OTf)$_3$ (5 mol%, 0.05 eq) and methyl pyruvate (2.2 eq) was added to the mixture. This mixture were stirred at room temperature (For the time see: Table 3) until the starting material was completely consumed as monitored by tlc. The resultant residue was directly purified by flash chromatography on silica (EtOAc:Cyclohexane 2:98). All solid products were recrystallized over pentan and ethyl acetate.

General procedure for the synthesis of 1,2-dihydroquinolines under microvawe conditions

N-Substituted aniline (100 mg, 1 eq) was dissolved in acetonitrile (1.5 ml) then Bi(OTf)$_3$ (5 mol%, 0.05 eq) and methyl pyruvate (2.2 eq) were added to the solution. This mixture were heated by microwave irradiation (10 bar, 150 watt, 100℃, See for the time: Table 1,2 and 3).
The progress of the reaction was monitored through tlc. The resultant residue was directly purified by flash chromatography on silica (EtOAc:Cyclohexane 2:98). All solid products were recrystallized over pentan and ethyl acetate. By this method the following compounds were prepared.

Crystal data for 9: C\textsubscript{12}H\textsubscript{11}ClN\textsubscript{2}O\textsubscript{4}, M = 282.68, crystallizes as colourless blocks, crystal dimensions 0.50 x 0.30 x 0.20 mm. Monoclinic, a = 7.5735(10) Å, b = 14.407(2) Å, c = 11.6615(14) Å, \(\beta = 96.641(10)^{\circ}\), V = 1263.9(3) Å\textsuperscript{3}, z = 4, \(D_c= 1.486\) Mgm\textsuperscript{-3}, space group P2\textsubscript{1}/c (No. 14), MoK\textalpha\ radiation (\(\lambda = 0.71073\)), \(\mu = 0.314\) mm\textsuperscript{-1}, F(000) = 584.

The X-ray data were collected at 293(2) K in the range 4.5° < 2θ < 56° on a Nicolet P3/F diffractometer by the Wyckoff scan method. The 3044 unique reflections were corrected for Lorentzian polarization effects, but not for absorption. Intensity of 1647 reflections were larger than \(2\sigma(I)\). The structure was solved by Direct Methods and refined by full matrix least squares methods of F\textsuperscript{2} with SHELXTL-97 program package. Hydrogen atoms were included in calculated positions and refined in riding mode. Refinement converged at a final \(R = 0.0850\) (wR\textsubscript{2} = 0.1548, I>2\sigma(I), 179 parameters, mean and maximum \(\delta/\sigma\) 0.000 and 0.000), with allowance of anisotropic displacement parameters for all non-hydrogen atoms. Minimum and maximum final rest-electron density is –0.255 and 0.263 eÅ\textsuperscript{-3}.
