#### Abstract

Aryl methyl ketones 1a-e gave with $N, N$-dimethylacetamide dimethylacetal (DMADMA) ( $E$ )-1-aryl-3-(dimethylamino)-but-2-en-1-ones 2a-e. Substitution of the $N, N$-(dimethylamino) group in the reaction with ammonium acetate afforded the corresponding ( $Z$ )-3-amino-1-aryl-but-2-en-1ones 3a-e. In the reaction of 3a-e with diethyl azodicarboxylate intermediates 4a-e were formed, which were, in most cases without isolation, cyclized into ethyl (5-aroyl-4-methyl-2-oxo-2,3-dihydro-1H-imidazol-1-yl)carbamates 5a-e. Hydrolysis of the ester group, followed by the decarboxylation and deamination of intermediates 6a-c,e produced 4-aroyl-5-methyl-1 H -imidazol-2(3H)-ones 7a-c,e.

Keywords: Aryl methyl ketones, enaminoines, 3-amino-1-arylbut-2-en-1-ones, (2-oxo-2,3-dihydro- 1 H -imidazol-1-yl)carbamates, 1 H -imidazol-2(3H)-ones.

## Introduction

Nitrogen containing heterocycles ${ }^{1}$ are of special interest in organic synthetic chemistry, since they occur in wide variety of natural products. The imidazolone motif appears in many natural products, ${ }^{2}$ which possess interesting biological activities. ${ }^{3}$ They are inhibitors of V-RAF murine sarcoma viral oncogene homologue B1. ${ }^{4}$ They are antagonists of many receptors including the neurokinin-1 receptor ${ }^{5}$ and the dopamine receptor. ${ }^{6}$ They were applied as intermediates in the synthesis of many natural products, such as biotin, ${ }^{7}$ slagenins, ${ }^{8}$ axinohydantoins, ${ }^{9}$ oroidin-derived alkaloids, ${ }^{10}$ aplysinopsins, ${ }^{11}$ Lancetta-derived alkaloid carcaridine A, ${ }^{12}$ and others. Due to their importance many methods have been developed for construction of imidazole ring. ${ }^{13,14}$ Recently,
there has been a great progress in copper-catalyzed N -arylation. ${ }^{15,16}$ 4-Aroyl-1,3-dihydro- 2 H -imidazol-2-ones, have been prepared by acylation of the appropriate 2 H -imidazol-2-ones and evaluated as a new class of cardiotonic agents. ${ }^{17}$ The most important compound in this series is 5-methyl-4-[4-(methylthio)benzoyl]-1 H -imidazol-2(3H)-one (Perfan or Enoximone) (Figure 1), a selective phosphodiesterase inhibitor, has a significant inotropic and vasodilating properties that have proved useful in the postoperative management of infants and children having cardiac surgery. ${ }^{18,19}$ Effects of phosphodiesterase (III/IV)-inhibitors and cytokines on mechanical properties of neutrophilic granulocytes in neonates and adults have been studied. ${ }^{20}$

Figure 1. 5-Methyl-4-[4-(methylthio)benzoyl]-1H-imidazol-2(3H)-one (Perfan or Enoximone).

The wide applicability of 3-(dimethylamino)-propenoates and related enaminones as versatile reagents in heterocyclic synthesis, ${ }^{21}$ parallel solution-phase and solid-phase synthesis of fused pyrimidinones, ${ }^{22}$ and stereochemical synthesis, ${ }^{23}$ including natural products and their analogues, e.g. the aplysinopsins, ${ }^{24}$ meridianines, ${ }^{25}$ dipodazines, ${ }^{26}$ and triprostatines ${ }^{27}$ has been demonstrated. Recently, a simple one-pot synthesis of ethyl 4-benzoyl-2-oxo-3-substituted-2,3-dihydro- $1 H$-imidazol-1-yl)carbamates has been described. ${ }^{28}$

In this communication we report a simple synthesis of ethyl (5-aroyl-4-methyl-2-oxo-2,3-dihydro- 1 H -imidazol-1-yl)carbamate followed by hydrolysis of the ester group, decarboxylation and deamination to give 4-aroyl-5-methyl-1 H -imidazol-2 $(3 \mathrm{H})$-ones.

## Results and Discussion

In this paper we report the preparation of 5-methyl-4-(aroyl substituted)imidazol-2(1H)-ones starting from aryl methyl ketones 1a-e, which were transformed by treatment with $\mathrm{N}, \mathrm{N}$-dimethyl acetamide dimethylacetal (DMADMA) into ( $E$ )-3-(dimethylamino)-1-(4-substituted-phenyl)but-2-en-1-ones 2a-e. These were treated with ammonium acetate to form (Z)-3-amino-1-(4-substituted-phenyl)but-2-en-1-ones 3a-e. By further reaction with diethyl azodicarboxylate (DEAD) intermediates 4a-e were formed which cyclize after addition of sodium hydroxide under experimental conditions into ethyl [5-aroyl-4-methyl-2-oxo-2,3-dihydro-1 H -imidazol-1yl]carbamates 5a-e. After hydrolysis of the ester group, followed by decarboxylation and deamination, 4-aroyl-5-methyl-1H-imidazol-2(3H)-ones 7a-c,e were isolated.

In our first attempt to synthesize 5-methyl-4-[(4-methylthio)benzoyl]-1H-imidazol-2(1H)one (7a) (Enoximone or Perfan) we treated 1-[(4-methylthio)phenyl]ethanone (1a) with
dimethylacetamide dimethylacetal (DMADMA) in dry toluene to afford ( $E$ )-3(dimethylamino)-[(4-methylthio)phenyl]but-2-en-1-one (2a) as an yellow oil in $\sim 5 \%$ yield. By further treatment of this compound with ammonium acetate in MeOH for 18 h at room temperature the corresponding (Z)-3-amino-1-[(4-methylthio)phenyl]but-2-en-1-one (3a) was obtained practically quantitatively as a yellow solid. In the reaction of $\mathbf{3 a}$ with diethyl azodicarboxylate (DEAD) in EtOH for 2 h at room temperature, without the isolation of the intermediate $\mathbf{4 a}$, ethyl [4-methyl-5-(4-methylthio)benzoyl]-2-oxo-2,3-dihydro-1H-imidazol-1-yl]carbamate (5a) was isolated in $68 \%$ yield upon addition of NaOH to $\mathbf{4 a}$. At the end $\mathbf{5 a}$ was hydrolyzed and decarboxylated by heating at reflux temperature in an aqueous ethanolic KOH solution for 20 h to afford 1-amino-4-methyl--(4-methylthio)benzoyl)-1 H -imidazol-2(3H)-one ( $\mathbf{6 a}$ ) which was directly deaminated to 5-methyl-4-(4-(methylthio)benzoyl)-1 H -imidazol-2(3H)-one (7a) in $93 \%$ overall yield. However, the overall yield starting from 1a was very low ( $<3 \%$ ).

In order to avoid the extremely poor yield in the transformation of 1a into 2a, we extended the reaction to a number of aryl ketones $\mathbf{1 b} \mathbf{- f}$ and prepared the corresponding analogues of enoximone 7a. (Scheme 1, Table 1). We found that 1-(4-fluorophenyl)ethanone (1f) could be transformed with DMADMA into ( $E$ )-3-(dimethylamino)-1-1(4-fluorophenyl)but-2-en-1-one ( $\mathbf{2 f}$ ) in $67 \%$ yield. The substitution of fluorine with MeSNa afforded $(E)$-3-(dimethylamino)-1-1-(4-(methylthio)phenyl)but-2-en-1-one (2a) in $80 \%$ yield. In this way, following the reaction sequence $\mathbf{1 f} \rightarrow \mathbf{2 f} \rightarrow \mathbf{2 a} \rightarrow \mathbf{3 a} \rightarrow \mathbf{4 a} \rightarrow \mathbf{5 a} \rightarrow \mathbf{6 a} \rightarrow \mathbf{7 a}$, the overall yield was $32 \%$ (Scheme 2).

## Scheme 2

The structure of (E)-1-aryl-3-(dimethylamino)but-2-en-1-ones 2a-e is supported by X-ray analysis for compound 2d (Figure 2). The orientation around the double bond in compounds $\mathbf{2}$ and $\mathbf{3}$ was determined on the basis of chemical shifts. In compounds $\mathbf{2}$ the methyl group appear downfield ( $\delta=2.50-2.67 \mathrm{ppm}$ ) in comparison to the chemical shift of methyl group in compounds 3 ( $\delta=2.05-2.09 \mathrm{ppm}$ ). Furthermore, in ( $Z$ )-3-amino-1-aryl-but-2-en-1-ones (3) a large difference in chemical shifts ( $\sim 5 \mathrm{ppm}$ ) for both protons attached to the amino group was observed, due to the strong intramolecular hydrogen bond of one proton to carbonyl group (Figure 2).

## Conclusions

In summary, a new synthetic method for the preparation of 4-aroyl-5-methyl- 1 H -imidazol$2(3 H)$-ones (7a-c,e) (Enoximone analogues) was developed. The synthesis started with commercially available methyl ketones 1a-f which were transformed with DMADMA into ( $E$ )-1-aryl-3-(dimethylamino)-but-2-en-1-ones 2a-e. Substitution of the $N, N$-(dimethylamino) group with $\mathrm{NH}_{4} \mathrm{OAc}$ afforded the corresponding ( $Z$ )-3-amino-1-aryl-but-2-en-1-ones 3a-e. In the reaction of 3a-e with diethyl azodicarboxylate intermediates 4a-e were formed, which were cyclized into ethyl 5-aroyl-4-methyl-2-oxo-2,3-dihydro-1H-imidazol-1-yl)carbamates 5a-e. Hydrolysis of the ester group, followed by the decarboxylation and deamination of 1-amino-5-aroyl-4-methyl- 1 H -imidazol-2(3H)-ones 6a-c, $\mathbf{e}$ as intermediates produced 4-aroyl-5-methyl- 1 H -imidazol-2(3H)-ones 7a-c,e (Enoximone analogues).

## Experimental Section

General. Melting points were determined on a Kofler micro hot stage and on a SRS OptiMelt MPA100-Automated Melting Point System. NMR spectra were obtained on a Bruker Avance DPX 300 at 300 MHz for ${ }^{1} \mathrm{H}$ and 75.5 MHz for ${ }^{13} \mathrm{C}$, and a Bruker UltraShield 500 plus at 500 MHz for ${ }^{1} \mathrm{H}$ and 126 MHz for ${ }^{13} \mathrm{C}$, using DMSO- $d_{6}$ and $\mathrm{CDCl}_{3}$ with TMS as the internal standard, as solvents. Mass spectra were recorded on an AutoSpecQ spectrometer and Agilent 6224 Accurate Mass TOF LC/MS, IR spectra on a Perkin-Elmer Spectrum BX FTIR spectrophotometer. The microanalyses for $\mathrm{C}, \mathrm{H}$, and N were performed on a Perkin-Elmer CHN Analyser 2400 II. Column chromatography (CC) was performed on silica gel (Fluka, Silica gel 60, particle size: $0.035-0.070 \mathrm{~mm}$ ).

## 4-(4-Bromobenzoyl)-5-methyl-1H-imidazol-2(3H)-one (7e)

Ethyl (5-(4-bromobenzoyl)-4-methyl-2-oxo-2,3-dihydro-1H-imidazol-1-yl)carbamate (5e) (421.5 $\mathrm{mg}, 1.5 \mathrm{mmol}$ ) was dissolver in $\mathrm{EtOH}(5 \mathrm{~mL}) \mathrm{KOH}$ was added ( $1.00 \mathrm{~g}, 17.85 \mathrm{mmol}$ ) and reaction mixture refluxed for 12 h . Volatile components were evaporated the solid residue dissolved in $\mathrm{H}_{2} \mathrm{O}(5 \mathrm{~mL})$ and concentrated solution of $\mathrm{HCl}_{(\mathrm{aq})}(2 \mathrm{~mL})$ was added. Reaction mixture was than chilled to $0{ }^{\circ} \mathrm{C}$ and $6 \mathrm{M} \mathrm{NaNO}_{2(\text { aq })}(5 \mathrm{~mL})$ was slowly added during 20 min . When all $\mathrm{NaNO}_{2(\text { aq })}$ was added the reaction mixture was stirred further for 20 min at room temperature. White solid precipitated which was filtered and washed with $\mathrm{Et}_{2} \mathrm{O}(3 \times 5 \mathrm{~mL})$. Recrystallization from $\mathrm{H}_{2} \mathrm{O}$. ## X-ray structure analysis for compound 2d

The reflection data were collected on a Nonius Kappa CCD diffractometer using monochromated Mo Ka radiation at room temperature by using Nonius Collect software. ${ }^{32}$ Data reduction and integration were performed with the software package DENZO-SMN. ${ }^{33}$ The coordinates of all of the nonhydrogen atoms were found via direct methods using the SIR97 structure solution program. ${ }^{34}$ A full-matrix least-squares refinement on $F^{2}$ magnitudes with anisotropic displacement parameters for all non-hydrogen atoms using SHELXL-97 was employed. ${ }^{35}$ All H atoms were initially located in difference Fourier maps and subsequently treated as riding atoms in geometrically idealized positions with bond lengths $\mathrm{C}-\mathrm{H} 0.96 \AA$ for methyl and $0.93 \AA$ for aromatic hydrogens with $\operatorname{Uiso}(\mathrm{H})=1.5 \mathrm{Ueq}(\mathrm{C}$, methyl) and $\operatorname{Uiso}(\mathrm{H})=1.2 \mathrm{Ueq}(\mathrm{C}$,aromatic $)$, respectively. Figures depicting the structures were prepared by ORTEP3. ${ }^{36}$ CCDC-939062 contains the supplementary crystallographic data for structure 2d. These data can be obtained free of charge from The Cambridge Crystallographic Data Centre via www.ccdc.cam.ac.uk/data_request/cif.

## Acknowledgements

Financial support from the Slovenian Research Agency through grants P0-0502-0103, P1-0179 and J1-6689-0103-04 and grant Packet X-2000 and PS-511-102 for the purchase of Kappa CCD Nonius diffractometer are gratefully acknowledged. We also thank the Krka d.d. (Novo mesto, Slovenia) and Lek d.d., a Sandoz Company (Ljubljana, Slovenia) for financial support.
