Abstract
A new series of 4,4-dimethyl-2,6-dioxocyclohexane-thiocarboxamides were prepared by reaction of aryl isothiocyanate with dimedone. Reaction of N-aryl-4,4-dimethyl-2,6-dioxocyclohexanethiocarboxamides with hydrazonoyl halides led to the formation of the corresponding thiadiazoles. Treatment of 2-[5-acetyl-3-phenyl-1,3,4-thiadiazol-2(3H)-ylidene]-5,5-dimethylcyclohexane-1,3-dione with dimethylformamide dimethylacetal (DMF-DMA) in refluxing dioxane afforded (E)-2-[5-(3-(dimethylamino)acryloyl)-3-phenyl-1,3,4-thiadiazol-2(3H)-ylidene]-5,5-dimethylcyclohexane-1,3-dione. Reaction of the latter enaminone with hydrazonoyl halides yielded the corresponding 2-(1-aryl-3-substituted-pyrazol-4-carbonyl)-5-[3-phenyl-5-(5,5-dimethylcyclohexane-1,3-dione)-[1,3,4]-thiadiazole] derivatives. The structures of the new compounds were elucidated on the basis of their elemental analyses and spectral data.

Keywords: Dimedone, thioanilide, enaminone, thiadiazole, hydrazonoyl halides

Introduction

A literature survey revealed that many substituted 1,3,4-thiadiazole derivatives exhibit wide range of biological activities such as antimicrobial, antituberculosis, antiviral, anti-inflammatory, anticancer, antidiabetic and anticonvulsant activities.¹ In the light of these activities and in continuation of our work dealing with chemistry of hydrazonoyl halides,¹⁻²⁰ it was thought interesting to synthesize new functionalized 1,3,4-thiadiazole derivatives and evaluate their pharmaceutical activities. The synthetic strategy adopted for the target compounds is based on reactions of hydrazonoyl halides with 4,4-dimethyl-2,6-dioxocyclohexane-thiocarboxamides 3 (Scheme 1). Such reactions have not been reported hitherto. Our interest in such a study is to shed some light on the site selectivity in the target cycloaddition reactions of nitrilimines to 3 as the latter compounds contain three dipolarophilic sites namely C=O, C=C and C=S groups.
Results and Discussion

The required 4,4-dimethyl-2,6-dioxycyclohexane-thiocarboxamides 3a-c were prepared herein by reaction of 5,5-dimethylcyclohexane-1,3-dione 1 with each of aryl isothiocyanates 2a-c in dimethylformamide in the presence of potassium hydroxide (Scheme 1). The structures of the products 3a-c were substantiated by their microanalyses and spectral (MS, IR, NMR) data (see Experimental). For example, their IR spectra revealed, in each case, two carbonyl bands at ν 1696, 1664 cm\(^{-1}\) and NH band near ν 3217 cm\(^{-1}\). Their \(^1\)H NMR spectra showed, in addition to the aromatic protons multiplet, two characteristic singlet signals at δ 1.12 (6H, 2CH\(_3\)) and 2.65 (4H, 2CH\(_2\)) and two other singlet signals at δ 14.00 and 17.39 assignable to -NH and -OH protons, respectively. Such data indicate that compounds 3 in DCCl\(_3\), each exists as a mixture of two tautomeric forms 3A and 3B (Scheme 1).

Next, the reactions of 3 with the hydrazonoyl halides 4 were examined. In our hands, stirring of 3a with each of the hydrazonoyl halides 4 in acetonitrile at room temperature in the presence of triethylamine as a base catalyst afforded, in each case, one isolable product as evidenced by TLC analysis of the crude product (Scheme 2). The structure of the isolated products proved to be 5 on the basis of both elemental and spectral (MS, IR, NMR) analyses (see Experimental) and by alternate synthesis as outlined below. For example, the IR spectra of the products 5 reveal, in each case, the presence of two carbonyl bands in the region ν 1713-1652 cm\(^{-1}\).

Similar reactions of the appropriate hydrazonoyl halides 4 with each of 3b and 3c under the same reaction conditions afforded products that proved identical in all respects (mp, mixed mp, MS, IR and NMR spectra) with those obtained from reactions of 3a and 4. This finding indicates that the studied reactions of 3 with 4 involve the elimination of ArNH\(_2\) molecule. To account for the formation of 5, it is suggested as depicted in Scheme 2 that the reaction involves initially the formation of the intermediate cycloadduct I which undergoes \textit{in situ} elimination of aniline molecule to give 5 as end products (Scheme 2). Alternatively, the reaction involves first the formation of the thiohydrazonate ester II which undergoes \textit{in situ} cyclization followed
by elimination of aniline molecule (Scheme 2). These two suggested pathways are consistent with other literature reports on reactions of hydrazonoyl halides with other thioanilides.

Scheme 2

Treatment of compound 5Aa with dimethylformamide dimethylacetal (DMF-DMA) in refluxing dioxane, yielded the corresponding enaminone 6 (Scheme 3). The structure of the latter enaminone 6 was confirmed by its spectra and elemental analyses. For example, its IR spectrum showed two C=O bands in the region ν 1635–1650 cm⁻¹. In addition to the signals of the aromatic protons, its ¹H NMR spectrum revealed two singlet signals at δ 0.96 (6H, 2CH₃) and δ 2.23 (4H, 2CH₂) and a singlet signal at 2.93–3.20 (6H, N(CH₃)₂). Also, such spectrum showed two characteristic doublet signals at δ 5.77–5.81 (1H, d) and 7.88-7.90 (1H, d) with coupling
constant J=13 Hz assignable to the two olefinic protons. This coupling constant value indicates that the enaminone 6 has the E-configuration.

The reactions of the enaminone 6 as dipolarophile, with the nitrilimines generated in situ by base-catalyzed dehydrohalogenation of the hydrazonoyl halides 4, were next examined (Scheme 3). In our hands, reaction of 6 with each of the hydrazonoyl halides 4 in refluxing chloroform in the presence of triethylamine yielded, in each case, a single product. The isolated products were identified, on the basis of their elemental analysis and spectral (IR, NMR and MS) data (Experimental Section), as the respective 2-(1-aryl-3-substituted-pyrazol-4-carbonyl)-5-[3-phenyl-5-(5,5-dimethylcyclohexane-1,3-dione)-[1,3,4]-thiadiazole] derivatives 7 (Scheme 3). For example, the 1H NMR spectra of the products isolated showed, in each case, a singlet signal (1H) in the region δ 8.52-9.53, which corresponds to the distinct H-5 proton of the pyrazole ring residue in such products.

Experimental Section

General. Melting points were determined on a Stuart melting point apparatus and are uncorrected. The IR spectra were measured as KBr pellets on a FTIR Bruker-Vector 22 spectrophotometer. The 1H NMR and 13C NMR spectra were recorded in CDCl3 or [D6] DMSO on a Varian Mercury VXR 300 spectrometer (300 MHz for 1H NMR and 75 MHz for 13C NMR) using TMS as internal standard. Mass spectra were measured on a Shimadzu GCMS-Q-1000 EX mass spectrometer at 70 eV. The elemental analyses were carried out at the Microanalytical
Center, Cairo University using Automated analyzer CHNS, Vario EL III, Elementar, Germany. The hydrazonoyl halides 4 were prepared using the reported procedures 24-32

**General procedure for N-aryl 4,4-dimethyl-2,6-dioxocyclohexane-thiocarboxamides (3a-c).** 5,5-Dimethylcyclohexane-1,3-dione 1 (14.0 g, 0.1 mol) was added to a solution of potassium hydroxide (5.6 g, 0.1 mol) in dimethylformamide (100 mL). The mixture was stirred until dimedone dissolved. The appropriate aryl isothiocyanate 2 (0.1 mol) was then added to the reaction mixture. The reaction mixture was stirred overnight and then acidified with acetic acid. The solid formed was collected and crystallized from ethanol to give the corresponding thioamide 3. The compounds 3a-c prepared together with their physical constants are listed below.

**N-phenyl 4,4-dimethyl-2,6-dioxocyclohexane-thiocarboxamide (3a).** Yellow needles, yield 22.55 g, 82%, mp 140-141 °C IR (νmax, cm⁻¹): 3217 (NH), 1697 and 1664 (C=O) cm⁻¹. ¹H NMR (300 MHz, CDCl₃): δ 1.12 (6H, s, 2CH₃), 2.50 (2H, s, CH₂), 2.65 (2H, s, CH₂), 7.27-7.48 (5H, m, Ph), 14.00 (1H, s, NH) and 17.39 (1H, s, OH). ¹³C NMR (75 MHz, CDCl₃): δ 27.3 (CH₃), 29.8 (CMe₂), 51.2 (CH₂), 108.1 (C(CO)₂), 120.7, 125.3, 127.1 and 128.9 (Ph), 187.9 (C=S), 190.2 (dimedone-CON). Anal. Calcd. for C₁₅H₁₅NO₂S (275): C, 65.44; H, 6.22; N, 5.09; S, 11.62%. Found: C, 65.70; H, 6.10; N, 4.80; S, 11.44%.

**N-(4-Chlorophenyl) 4,4-dimethyl-2,6-dioxocyclohexane-thiocarboxamide (3b).** Yellow blocks crystals, yield 24.70 g, 80%, mp 160-162 °C IR (νmax, cm⁻¹): 3210 (NH), 1695 and 1660 (C=O) cm⁻¹. ¹H NMR (300 MHz, CDCl₃): δ 1.11 (6H, s, 2CH₃), 2.45 (2H, s, CH₂), 2.70 (2H, s, CH₂), 7.27-7.52 (4H, m, Ar), 14.01 (1H, s, NH) and 17.39 (1H, s, OH). General procedure for 2-(1-aryl-3-substituted-pyrazol-4-carbonyl)-5-(3-phenyl-5-(5,5- dimethylcyclohexane-1,3-dione)-[1,3,4]thiadiazole derivatives (7). To a solution of the enaminone 6 (2 g, 0.005 mol) and the appropriate hydrazonoyl halide 4 (0.005 mol) in chloroform CHCl₃ (50 mL), triethylamine TEA (2 ml) was added. The reaction mixture was refluxed for 6 h. The solvent was evaporated then ethanol was added. The solid that precipitated was collected, washed with ethanol and crystallized from a suitable solvent to give the corresponding products 7. The compounds 7 prepared together with their physical constants are given below.
