Abstract
1,3-Dimethylbenzisochromene-5,10-quinone 14 is obtained in good yield when 2-(1'-hydroxyethyl)-3-prop-2'-enyl-1,4-naphthoquinone 13 is treated briefly with bisacetonitriledichloropalladium(II) in solution in dichloromethane at room temperature.

Keywords: Benzisochromenequinones, naphthoquinone, isacetonitriledichloropalladium

Introduction

Significant interest continues to be shown in the synthesis of naturally occurring benzisochromanequinones,1 compounds which collectively possess a considerable array of biological properties.2 The pyran ring of the targets has the potential for three asymmetric centres, and considerable effort has been expended in achieving the desired stereochemistry, both for the racemates3-6 and for the enantiopure compounds.7-9 Naturally occurring benzisochromenequinones have also been reported,1 although their syntheses have hitherto received less attention. Nevertheless, two elegant short assemblies of these compounds from 2-(1'-hydroxyethyl)-1,4-naphthoquinone have been reported recently,10,11 and the former method extended to the assembly of the related benzisochromanequinones through stereoselective reduction. We have shown previously that 3-allyl-2-(1'-hydroxyethyl)-1,4-dimethoxynaphthalene 1 undergoes a completely diastereoselective base-induced cyclisation to afford solely the isomeric trans 1,3-dimethylnaphthopyran 2 in virtually quantitative yield,12 and that the conjugated double bond structural isomer 3 of substrate 1 undergoes oxidative cyclisation with ceric ammonium nitrate (four equivalents) to yield directly the 7,9-dideoxy analogues 4 and 513 of the aphid insect pigment derivatives quinone A 6 and quinone A' 7.14 Quinone A and glucoside B 8 are products derived from the reduction of protoaphin-fb,14 A by-product of this
reaction was identified as the benzisochromenequinone, anhydroquinone A.\textsuperscript{9,14,15}

Scheme 1

Scheme 2

\textsuperscript{6} R\textsubscript{1} = \text{OH}, R\textsubscript{2} = \text{H}

\textsuperscript{7} R\textsubscript{1} = \text{H}, R\textsubscript{2} = \text{OH}
The same compound was obtained by treatment of either quinone A 6 or quinone A’ 7 with acid.15 Following our interest in the assembly of derivatives of the aphid insect pigments, we report now16 on a ready synthesis of the benzisochromenequinone 14 as a model for the assembly of anhydroquinone A 9 through a palladium-initiated cyclisation of the 3-allyl-2-(1'-hydroxyethyl)-1,4-naphthoquinone 13, the quinonoid analogue of naphthalene 1.

Results and Discussion

There are many examples of nucleophilic addition to a double bond activated by coordination with a palladium(II) complex.17 Intramolecular alkoxy palladation/elimination of hydroxyalkenes is also well known. In 1985, Semmelhack et al. reported the formation of the benzisochromene 10 in a 9% yield as a by-product in the synthesis of methyl dihydronaphthopyranacetates using a palladium(II) catalysed olefin carbonylation reaction in methanol.18 In the absence of carbon monoxide and methanol, a simple alkenol was cyclised to a mixture of two pyrans, the ratio of which was dependent on the choice of solvent.19 We had shown, on the other hand, that catalytic quantities of bisacetonitriledichloropalladium(II) isomerise an (E)/(Z) mixture of an ortho-hydroxyalkylstylene into the pure (E)-isomer.20

The known12 naphthalene 1 was conveniently prepared here in high overall yield from 2-
acetyl-4-allyloxy-1-methoxynaphthalene \( 11,^{21} \) which was subjected to a Cope isomerisation and methylation, followed by reduction.\(^{12} \) Initially, a solution of naphthalene \( 1 \) in dichloromethane was treated at room temperature with one equivalent of bis(acetonitrile)dichloropalladium(II). The reaction was completed in three minutes to give a 50% yield of benzisochromene \( 12 \) (Scheme 3).

\[ \text{Scheme 3} \]

In this instance, no other material was recovered. Different conditions and amount of reagent did not significantly increase the yield. It was found that when the reaction was performed at 0 °C, or 0.3 equivalents of reagent were used, then conjugated isomer \( 3 \) of \( 1 \) was also isolated. This last case, in which significantly less than one equivalent of palladium complex was used, led to the highest recovery of material with little cost to the yield of cyclised product. These results are summarized in Table 1.

It was found that if the conjugated material \( 3 \) was treated with one equivalent of the same palladium(II) reagent then a 48% yield of benzisochromene \( 12 \) was obtained (Scheme 3). It was not possible, however, to oxidise this benzisochromene \( 12 \) to the corresponding 5,10-quinone \( 14 \) using standard conditions, including silver(II) oxide,\(^{22} \) ceric ammonium nitrate\(^{23} \) and others.\(^{24} \)

As an alternative, the possibility of cyclising 3-allyl-2-((1'-hydroxyethyl)-1,4-naphthoquinone \( 13 \) was investigated. The naphthalene derivative \( 1 \) was oxidised smoothly with ceric ammonium nitrate (two equivalents) to give the quinone \( 13 \) in 86% yield. This outcome is in sharp contrast to the alternative oxidative cyclisation mentioned above (Scheme 2) which is achieved for the isomeric conjugated propenyl substituent.\(^{13} \) The use of ceric ammonium nitrate (four equivalents) gave the same quinone \( 13 \), but in reduced yield (72%), presumably as a consequence of oxidative decomposition of this product.

The quinone \( 13 \) was then treated with bis(acetonitrile)dichloropalladium(II) to form the benzisochromenequinone \( 14 \) in reasonable yield (Scheme 4). The best result was found to be a 60% yield (82% based on consumed starting material) when 0.15 equivalents of palladium(II) reagent were used at room temperature. Larger amounts of the palladium(II) reagent gave lower yields. These results are summarised in Table 2. It is noteworthy that material not cyclised at the quinonoid level was the non-conjugated starting material \( 13 \), whereas non-cyclised material
recovered from the cyclisation of naphthalene 1 is the conjugated isomer 3.

This method therefore has the potential to provide access to naturally occurring benzisochromenequinones. Assembly of the naphthoquinone 13 in monochiral form would provide the correct absolute stereochemistry at C-1 of the benzisochromenequinone, as in anhydroquinone A 9.

Experimental Section
1,4-Dimethoxy-2-(1'-hydroxyethyl)-3-prop-2''-enylnaphthalene (1). Compound 1121 (192 mg, 0.74 mmol) was heated at 160 °C for 7 h. The unstable residue was identified by 1H NMR spectroscopy as the known 2-acetyl-3-allyl-1-methoxy-4-naphthol.21 Without further purification the crude product was then dissolved in dry acetone (15 mL) containing dimethyl sulphate (0.285 g, 2.26 mmol). Potassium carbonate (0.313 g, 2.26 mmol) was then added and the mixture heated under reflux overnight (13 h). The solution was cooled, filtered and the filtrate concentrated under reduced pressure. The residue was dissolved in diethyl ether and washed with aqueous ammonia solution (28%) and water. The crude solution was dried over magnesium sulphate and chromatographed (radial, 10% ethyl acetate-petroleum ether) to give the known12 2-acetyl-1,4-dimethoxy-3-prop-2''-enylnaphthalene (186 mg, 92%), which was reduced according to the literature.12

5,10-Dimethoxy-1,3-dimethylbenzisochromene (12). Method A [From compound 1] Bis(acetonitrile)dichloropalladium (II) (0.111 g, 0.43 mmol) was added to a solution of compound 1 (0.212 g, 0.78 mmol) in dry dichloromethane (10 mL) at 0 °C and the mixture stirred at 0 °C for 1 h. The mixture was concentrated under reduced pressure and passed through a silica plug (5% ethyl acetate-petroleum ether). The crude product was then chromatographed (radial, 10% ethyl acetate-petroleum ether) to give two products: The higher Rf compound was identified as the title product 12 (0.110 g, 52%) (Found: C, 75.2; H, 6.95. C17H18O3 requires C, 75.5; H, 6.7%) (Found: M+, 270.1260. C17H18O3 requires M, 270.1256); νmax 2928 (C-H), 1653 (C=C); δH 1.47 (3H, d, J 6.6, 1-CH3), 2.00 (3H, d, J 0.7, 3-CH3), 3.89 and 3.95 (each 3H, s, 5-OCH3 and 10-OCH3), 5.75 (1H, q, J 6.6, 1-H), 5.98 (1H, q, J 0.7, 4-H), 7.36–7.47 (2H, m, 7-H and 8-H), 7.95–8.04 (2H, m, 6H and 9-H); δC 20.6 (1-CH3),a 20.8 (3-CH3),a 61.9 (5-OCH3),b 62.2 (10-OCH3),b 70.0 (C1), 94.6 (C-4), 119.9 (C-4a),c 122.1 (C-6),d 122.2 (C-7),d 123.0 (C-5a),c 124.8 (C-8),d 126.0 (C-9),d 127.2 (C-9a),c 128.7 (C-10),c δ/z 270 (M+, 100), 269 (20), 255 (51), 237 (28), 227 (23), 225 (44), 197 (14), 196 (19), 193 (11), 181 (14), 169 (12), 168 (10), 165 (17), 153 (16), 152 (38), 141 (18), 139 (18), 120 (23), 115 (44), 110 (14), 104 (11), 89 (12), 77 (13), 76 (21), 51 (10). The lower Rf product was identified as the known13 trans-2-(1'-hydroxyethyl)-1,4-dimethoxy-3-prop-1''-enylnaphthalene 3 (14 mg, 7%); δH 1.63 (3H, d, J 6.7, 1'-CH3), 1.98 (3H, dd, J 1.7 and 6.5, 2''-CH3), 3.79 and 4.04 (each 3H, s, 1-OCH3 and 4-OCH3), 5.34 (1H, dq, J 6.7 and 8.2, 1'-H), 6.07 (1H, dq, J 6.5 and 16.0, 2''-H), 6.57 (1H, dq, J 1.7 and 16.0, 1''-H), 7.46–7.53 (2H, m, 6-H and 7-H), 7.97–8.04 (1H, m, 5-H or 8-H), 8.07–8.15 (1H, m, 5-H or 8H); δC 19.2 (C-2''), 24.7 (C-3''), 60.8 (1-OCH3),a 63.4 (4-OCH3),a 67.4 (C-1'), 122.1 (C1''),b 122.8 (C-5'),b 124.0 (C-6'),b 125.9 (C-2'),c 126.0 (C-7'),b 126.1 (C-8'),b 127.0 (C-3'),c 127.6 (C-4a),c 128.4 (C-8a),c 132.8 (C-2''), 149.9 (C-1),d 150.3 (C-4).d

Method B [From compound 3] Bis(acetonitrile)dichloropalladium (II) (40 mg, 0.154 mmol) was added to a solution of trans-2-(1'-hydroxyethyl)-1,4-dimethoxy-3-prop-1''-enylnaphthalene 3 (42 mg, 0.154 mmol) in dry dichloromethane (7 mL) and the mixture stirred for 11 min. The mixture was concentrated under reduced pressure and chromatographed (5% ethyl acetate-petroleum ether) to give the title compound 12 (20 mg, 48%).
2-(1'-Hydroxyethyl)-3-prop-2''-enyl-1,4-naphthoquinone (13). A solution of cerium(IV) ammonium nitrate (2.73 g, 4.98 mmol) in water (5 mL) was added, over 5 min, to a solution of compound 1 (0.339 g, 1.24 mmol) in acetonitrile (40 mL) and water (40 mL). The mixture was then stirred for 1 h. The solution was then poured into water and extracted with dichloromethane. The crude solution was dried (magnesium sulphate), concentrated, and chromatographed (10% ethyl acetate-petroleum ether) to give the known 3-(1'-hydroxyethyl)-2-prop-2''-enyl-1,4-naphthoquinone 13 as a bright yellow oil (0.259 g, 86%); δ_H 1.60 (3H, d, _J_ 6.8, 1'-CH₃), 3.45 (2H, dt, _J_ 1.5 and 6.3, 1''-CH₂), 3.91 (1H, d, _J_ 11.0, OH), 4.97 (1H, dq, _J_ 6.8 and 11.0, 1'-H), 5.11 (1H, dq, _J_ 1.5 and 10.0, vinyl CH₂), 5.14 (1H, dq, _J_ 1.5 and 17.0, vinyl CH₂), 5.84 (1H, ddt, _J_ 6.3, 10.0 and 17.0, vinyl CH), 7.70–7.76 (2H, m, 6-H and 7-H), 8.04–8.11 (2H, m, 5-H and 8-H); δ_C 23.6 (C-2'), 29.8 (C-1''), 67.2 (C-1''), 117.3 (C-3''), 126.2 (C-6), 126.5 (C-7), 131.6 (C-2), 132.2 (C-3), 133.5 (C-5), 133.8 (C-8), 134.0 (C-2''), 143.3 (C-4a), 146.4 (C-8a), 184.4 (C-1), 187.0 (C-4).

1,3-Dimethylbenzisochromene-5,10-quinone (14). Bis(acetonitrile)dichloro-palladium (II) (10 mg, 0.038 mmol) was added to a solution of compound 13 (61 mg, 0.252 mmol) in dry dichloromethane (8 mL) and the mixture stirred for 5 min. The bright red solution was concentrated under reduced pressure and passed through a silica plug (10% ethyl acetate-petroleum ether). The crude product was then chromatographed (radial, 10% ethyl acetate-petroleum ether) to give the title compound 14 as a bright red oil (36 mg, 60%) (Found: C, 74.95; H, 5.1. C₁₅H₁₂O₃ requires C, 75.0; H, 5.0%) (Found: M⁺, 240.0777. C₁₅H₁₂O₃ requires M, 240.0786; v_max 1671 (C=O), 1652 (C=O), 1559 (C=C); δ_H 1.41 (3H, d, _J_ 6.6, 1-CH₃), 2.03 (3H, s, 3-CH₃), 5.70 (1H, q, _J_ 6.6, 1-H), 5.89 (1H, s, 4-H), 7.64–7.74 (2H, m, 6-H and 9-H), 8.04–8.09 (2H, m, 7-H and 8-H); δ_C 18.1 (1-CH₃), 21.0 (3-CH₃), 69.7 (C-1), 93.2 (C-4), 125.8 (C-7), 126.35 (C-8), 126.45 (C-4a), 131.7 (C-5a), 132.6 (C-9a), 133.0 (C-6), 133.8 (C-9), 136.2 (C-10a), 162.8 (C3), 182.0 (C-5), 182.9 (C-10); m/z 241 (M₊+1, 17), 240 (M⁺, 35), 225 (100), 197 (38), 169 (26), 155 (14), 141 (53), 139 (47), 126 (13), 116 (12), 115 (81), 105 (51), 104 (22), 91 (14), 89 (21), 87 (12), 77 (34), 76 (75), 74 (21), 65 (28), 63 (35), 51 (25), 50 (38). Further elution afforded starting material 13 (17 mg).
