(received 21 Dec 04; accepted 14 Jan 05; published on the web 28 Jan 05)

Abstract
Direct nitration of a variety of furans, pyrroles, thiophenes, pyrazoles, imidazoles, isoxazoles and thiazoles (17 compounds) with nitric acid/trifluoroacetic anhydride affords mononitro derivatives in average yield of 60%.

Keywords: Nitration, nitric acid, trifluoroacetic anhydride, nitrofurans, nitropyroles, nitrothiophenes, nitropyrazoles, nitroimidazoles, nitroisoxazoles, nitrothiazoles

Introduction

Nitro derivatives of five-membered heterocycles are of considerable interest: some are biologically active1 with anti-inflammatory or vasodilator activity2 others are useful synthetic intermediates for many biologically active compounds; for instance, nitroimidazoles form the basis of nitro-heterocycles analogous to megazol, an antiparasitic agent3.

Nitration of five membered ring heterocycles like furans4, pyrroles5, thiophenes6, pyrazoles7, imidazoles8, isoxazoles9 and thiazoles10 has usually been carried out using either a mixture of concentrated (or fuming) nitric acid and concentrated sulfuric acid, or in some cases with concentrated nitric acid and acetic anhydride (followed by pyridine in case of furans only). The nitration of some of these heterocycles, for example pyrazoles and imidazoles11, isoxazoles12, 13 and isothiazoles12 has been studied kinetically. Previous efforts to find milder nitration conditions for direct nitration have included use of cerium (IV) ammonium nitrate14, montmorillonite impregnated with bismuth nitrate15 and nitrations with dinitrogen pentoxide16, 17.

In light of our success in the direct nitration of pyridines and pyridine analogs with concentrated nitric acid in trifluoroacetic anhydride, which we believe involves N₂O₅18 led us to apply this method to nitration of five-membered heterocycles and we discuss our results here.
While the present work was in progress, Shackelford and coworkers reported\textsuperscript{19} the use of tetramethylammonium nitrate in triflic anhydride and included results of nitration of aromatics like furans, thiophenes and isoxazoles. Our work complements and significantly extends that of Shackelford group.

**Results and Discussion**

**Furans**

Typically furans have been nitrated using acetyl nitrate to give addition products, which are subsequently converted on treatment with pyridine into 2-nitrofurans\textsuperscript{20, 21, 22, 23}. We have now achieved the direct nitration of furan itself and a series of its derivatives with nitric acid in trifluoroacetic anhydride (method A as described in the experimental section) (Scheme 1) (Table 1). Compounds 2a-d were characterized spectroscopically (see Experimental).

Method A is described in the Experimental section; \textsuperscript{a}using method A but replacing TFAA by Ac\textsubscript{2}O; \textsuperscript{b}overall yield is the final yield after multistep conversion to nitrofurans starting with furan; \textsuperscript{c}cross reference of the compound without reported yield; \textsuperscript{d}overall yield is 34\% following the reaction sequence 2-furfuraldehyde –[80\%]—2-furfuryl alcohol – [76\%]—2-iodomethyl-5-nitrofuran – [56\%]—2-methyl-5-nitrofuran; \textsuperscript{e}general method of synthesis of nitrofurans from furans in two steps using acetyl nitrate via an addition product which is subsequently converted by pyridine into 2-nitrofurans; \textsuperscript{f}indirect method starting from 2-iodomethyl-5-nitrofuran using thiophenolate anion as the reagent.

Inspection of Table 1 clearly shows the advantage of our new method. In most published nitration procedures for furan, nitroacetate intermediates had to be isolated. Our one step nitration procedure produces much higher yields without isolation of any intermediate.

**Pyrroles**

Again acetyl nitrate has been used for the nitration of pyrrole\textsuperscript{33}, to give mainly the 2-nitro derivatives (55\%). Our nitration method B, gave novel compounds 4a-b from 3a-b respectively (Scheme 2), structures were confirmed spectroscopically (see Experimental).

![Scheme 2](image)

**Thiophenes**

Thiophenes are easy to nitrate compared to other five membered heterocycles. They react with mild nitrating agents such as copper nitrate\textsuperscript{34}, usually in the 2-position. Thiophene (5), on nitration with our reagent gave a 78\% yield of 2-nitro derivative (6) by method B (Scheme 3) (Table 2). Shackelford reported the nitration of methyl 2-thiophene carboxylate to give a mixture of 2- and 4- nitro derivatives (1.6:1) in 91\% yield\textsuperscript{19}.

Method: B as described in the Experimental section; $^a$yield from thiophene; $^b$yield from thiophene 2-boronic acid; $^c$yield from 3-bromothiophene.

We found that the nitration of 3-bromo-thiophene (7) gave a complicated mixture with the main product (8) (58%). The other component were found to be 9, 10a-b, and 11. The structure of 10a was not unambiguously differentiated from the structure 10b (Scheme 4).

Scheme 4

Pyrazoles
Acetyl nitrate has been employed to nitrate pyrazoles at one of the nitrogen atoms and subsequent rearrangement at 140 °C has been observed to give 3- or 5-nitropyrazoles, sometimes as a mixture. Pyrazole (12) on treatment with our nitrating system following method B gave a 41% yield of the 3,4-dinitrated derivative (13) while N-methylpyrazole under the same reaction condition gave a 65% yield of the 3-nitro product (13). This orientation was confirmed by nOe experiments (Scheme 5) (Table 3).
Method B as described in the Experimental section; \(^a\) overall yield is the final yield after multistep conversion to nitropyrazole starting with pyrazole as starting material; \(^b\) overall yield is 68% following the reaction sequence as pyrazole – [80%] – 3-nitropyrazole – [86%] – 3,4-dinitropyrazole; \(^c\) overall yield is 28% following the reaction sequence as pyrazole – [90%] – 1-methylpyrazole – [32%] – 3,4-dinitropyrazole; \(^d\) overall yield is 53% following the reaction sequence as 3,5-dimethylpyrazole – [94%] – 4-bromo-3,5-dimethylpyrazole – [53%] – 3,5-dimethyl-4-nitropyrazole; \(^e\) cross reference of the compound without reported yield; \(^f\) direct conversion of pyrazole or its derivatives to nitropyrazole; \(^g\) ring cyclization to pyrazole using dinitromethane as one of the reactants.

3. 5-Dimethylpyrazole (14), on the other hand, gives only 3,5-dimethyl-4-nitropyrazole in 76% yield (Scheme 6) (Table 3).
Imidazoles

Imidazoles unsubstituted at nitrogen are easily nitrated by mixed acid nitration\textsuperscript{46,47}. The direct nitration of N-substituted imidazoles is more difficult and most nitro-N-methylimidazoles have been prepared by the N-methylation of the corresponding nitroimidazoles.

A mixture of 4-nitro- (17a) and 5-nitroimidazoles (17b) was obtained by the action of concentrated nitric acid on 1-methylimidazole (16) in trifluoroacetic anhydride at 0-5°C for 12.0 h according to method B (Scheme 7) (Table 4). Yields quoted for (17) and (19) are that of pure isomers isolated by column chromatography.

\begin{align*}

\end{align*}

Scheme 7

Similarly, a mixture of 1,2-dimethyl-4-nitroimidazole (19a) and 1,2-dimethyl-5-nitroimidazoles (19b) was obtained by the action of concentrated nitric acid on 1,2-dimethylimidazole (18) in trifluoroacetic anhydride at 0-5°C for 12.0 h according to method B (Scheme 8).

Method B as described in the Experimental section. a overall yield is the final yield after multistep conversion to nitroimidazole starting with imidazole as starting material. b overall yield is 22% following the reaction sequence as imidazole –[91%]—4-nitroimidazole – [24%]—1-methyl-4-nitropyrazole. c overall yield is 44% following the reaction sequence as imidazole – [91%]—4-nitroimidazole – [48%]—1-methyl-4-nitropyrazole. d overall yield is 34% following the reaction sequence as imidazole –[91%]—4-nitroimidazole – [37%]—1-methyl-4-nitropyrazole. e overall yield is 47% following the reaction sequence as 2-methylimidazole – [91%]—2-methyl-4-nitroimidazole – [52%]—1,2-dimethyl-4-nitroimidazole. f indirect conversion of imidazole to 4-nitro-1-methyl or 4-nitro-1,2-dimethyl imidazole through nitration and subsequent N-methylation of imidazoles.

**Isoxazoles**

Nitroisoxazoles have been synthesized using various nitrating agents like nitronium fluoroborate54, ammonium nitrate/TFAA55 or just nitration with mixed acid56. Our nitration method A when applied to nitration of isoxazole (20a), 5-methylisoxazole (20b) and 3,5-dimethylisoxazole (20c); 2-nitroisoxazole (21a), 5-methyl-3-nitroisoxazole (21b) and 3,5-dimethyl-4-nitroisoxazole (21c) were obtained in the yield of 73%, 64%, and 72% respectively. (Scheme 9) (Table 5). Shackelford19 found that 3,5-dimethylisoxazole was converted to the 4-nitro derivatives in 96% isolated yield using tetramethylammonium nitrate in triflic anhydride.

Method B as described in the Experimental section. <sup>a</sup>overall yield is the final yield of the conversion to nitroisoxazole starting with isoxazole as starting material. <sup>b</sup>cross reference of the compound without reported yield. <sup>c</sup>direct nitration method of isoxazole to nitrooxazole by using different reagents. <sup>d</sup>ring closure method to synthesize nitrooxazole.

Thiazoles

Nitration of thiazoles had not previously been studied extensively. 2,5-Dimethylthiazole (22), gave 2,5-dimethyl-4-nitrothiazole (23) in 67% yield (Scheme 10), which was characterized spectroscopically (see Experimental). We did not study the nitration of thiazole because it was insoluble in our nitration system.

![Scheme 10](image)

Experimental Section

General Procedures. Melting points are uncorrected. <sup>1</sup>H NMR (300 MHz) and <sup>13</sup>C NMR (75 MHz) spectra were recorded in CDCl₃ (with TMS for <sup>1</sup>H and chloroform-<i>d</i> for <sup>13</sup>C as the internal reference) unless specified otherwise.
General method of preparation of nitro derivatives of five membered heterocycles

**Method A.** A mixture of trifluoroacetic anhydride (10 mL) and fuming nitric acid (2.4 mL) was chilled at −15°C and after 1 h a solution of (10 mmol) in trifluoroacetic anhydride (2 mL) was slowly added to the reaction mixture keeping the temperature at -15°C. The reaction mixture was stirred at -15°C for 2 h and then the solvents were removed and pyridine (2 mL) was added to the reaction mixture, stirred for 15 min. And then the solvent was again removed and the oily residue was poured in ice and extracted with diethyl ether. The crude product was then purified over a silica gel column to give pure nitro derivatives.

**Method B.** Trifluoroacetic anhydride [10 mL] was chilled in an ice bath and the substrate heterocycle [17 mmol] was slowly added. After 1 h, concentrated nitric acid [3.0 mL] was added dropwise with cooling. After stirring for 12 h at room temperature, the excess trifluoroacetic acid and nitric acid were removed under vacuum to get the nitro derivatives, which were purified by column chromatography.

**Compound characterization**

**2-Nitrofuran (2a).** Yellowish microcrystals (68 %), mp 28.0−29.0 °C (lit.61 mp 28.8−29.2 °C). 1H NMR: δ 6.68 (dd, J = 3.6, 1.8 Hz, 1H), 7.34 (dd, J = 3.6, 1.0 Hz, 1H), 7.57 (dd, J = 1.8, 1.0 Hz, 1H); 13C NMR: δ 111.43, 113.35, 144.95, 152.71.

**2-Methyl-5-nitrofuran (2b).** White prisms (65 %), mp 42.5-43.5 °C (lit.62 mp 43.5 °C). 1H NMR: δ 2.46 (dd, J = 0.9, 0.5 Hz, 3H), 6.31 (dq, J = 3.6, 0.9 Hz, 1H), 7.26 (dq, J = 3.6, 0.5 Hz, 1H); 13C NMR: δ 13.98, 110.01, 113.19, 151.26, 156.84.

**2-(tert-Butyl)-5-nitrofuran (2c).** Yellowish prisms (75 %), mp 56.0-57.0 °C. 1H NMR: δ 1.36 (s, 9H), 6.24 (d, J = 3.8 Hz, 1H), 7.23 (d, J = 3.8 Hz, 1H); 13C NMR: δ 28.52, 33.45, 106.39, 112.75, 113.19, 151.26, 156.80. Anal. Calcd for C 8H11NO3 (169.18): C, 56.80; H, 6.55; N, 8.28. Found: C, 56.74; H, 6.75; N, 8.08.

**(Acetyloxy)(5-nitro-2-furyl) methyl acetate (2d).** White prisms (58 %), mp 88.6-90.0 °C (lit.30 mp 91.0-92.0 °C). 1H NMR: δ 2.18 (s, 6H), 6.74 (d, J = 3.7 Hz, 1H), 7.30 (d, J = 3.7 Hz, 1H), 7.72 (s, 1H); 13C NMR: δ 20.53, 82.45, 111.45, 112.29, 150.37, 168.05. Anal. Calcd for C9H9NO7 (243.17): C, 44.45; H, 3.73; N, 5.76. Found: C, 44.68; H, 3.67; N, 5.68.

**2,2,2-Trifluoro-1-(4-nitro-1H-pyrrol-2-yl)-1-ethanone (4a).** White prisms (81 %), mp 112.0–113.0 °C. 1H NMR: δ 7.64 (q, J = 1.8 Hz, 1H), 8.48 (d, J = 1.5 Hz, 1H), 13.86 (br s, 1H); 13C NMR: δ 116.14 (q, J<sub>C-F</sub> = 289.7 Hz), 114.68 (q, J<sub>C-F</sub> = 3.4 Hz), 124.22, 129.14, 137.76, 170.15 (q, J<sub>C-F</sub> =36.1 Hz). Anal. Calcd for C6H3F3N2O3 (208.10): C, 34.63; H, 1.45; N, 13.46. Found C, 34.71; H, 1.22; N, 13.26.

**2,2,2-Trifluoro-1-(1-methyl-4-nitro-1H-pyrrol-2-yl)-1-ethanone (4b).** White prisms (72 %), mp 63.5-64.5 °C. 1H NMR: 4.08 (d, J = 0.5 Hz, 3H), 7.69 (q, J = 1.8 Hz, 1H), 7.84 ( dq, J = 1.8, 0.6 Hz, 1H); 13C NMR: δ 38.99, 116.11, 117.29, 123.69, 131.28, 136.07, 171.33. Anal. Calcd for C7H5F3N2O3 (222.12): C, 37.85; H, 2.27; N, 12.61. Found C, 38.01; H, 2.13; N, 12.34.

**2-Nitrothiophene (6).** White prisms (78 %), mp 42.0–43.0 °C (lit.63 mp 45.5 °C). 1H NMR: δ 7.07 (q, J = 4.1, 5.3 Hz, 1H), 7.55 (dd, J = 1.6, 5.3 Hz, 1H), 7.93 (dd, J =1.6, 4.1Hz, 1H); 13C
NMR: $\delta$ 126.97, 128.54, 132.50, 152.58. Anal. Calcd for C$_4$H$_3$NO$_2$S (129.14): C, 37.20; H, 2.34; N, 10.85. Found C, 37.33; H, 2.22; N, 10.70.

3-Bromo-2-nitrothiophene (8). Yellowish prisms (58 %); mp 79.0-80.0 °C (lit.37 mp 81.0-83.0 °C). $^1$H NMR: $\delta$ 7.13 (d, $J = 5.6$ Hz, 1H), 7.54 (d, $J = 5.6$ Hz, 1H); $^{13}$C NMR: $\delta$ 112.95, 130.97, 132.54, 146.54. Anal. Calcd for C$_4$H$_2$BrNO$_2$S (208.03): C, 23.09; H, 0.97; N, 6.73. Found C, 23.38; H, 0.78; N, 6.53.

3-Bromo-5-nitrothiophene (9). Yellowish prisms (8 %); mp 45.0-46.0 °C (lit.64 mp 46-47.0 °C). $^1$H NMR: $\delta$ 7.47 (d, $J = 1.9$ Hz, 1H), 7.85 (d, $J = 1.9$ Hz, 1H); $^{13}$C NMR: $\delta$ 109.98, 129.46, 130.55, 152.06.

3-Bromo-4,5-dinitro-thiophene (10a or 10b). Yellow prisms (4 %); mp 178-180.0 ºC, lit.65 mp 165-166ºC for 10b; $^1$H NMR: $\delta$ 7.95 (s, 1H); $^{13}$C NMR: $\delta$ 112.82, 131.26, 133.17, 152.03.

3-Bromo-2,5-dinitro-thiophene (11). Yellow microcrystals prisms (10 %); m.p.: 111-112ºC, lit.67 m.p.: 112-113ºC; $^1$H NMR: $\delta$ 7.89 (s, 1H); $^{13}$C NMR: $\delta$ 111.28, 131.46, 148.40, 151.70.

3,4-Dinitro-1$^1$H-pyrazole (13a). White prisms (41 %); mp 90-91ºC (lit. 40 mp 87.5-88.5). $^1$H NMR: $\delta$ 8.57 (s, 1H); $^{13}$C NMR: $\delta$ 132.38, 133.58, 135.38.

1-Methyl-3-nitro-1$^1$H-pyrazole (13b). White prisms (65 %), mp 81.0–82.0 ºC (lit. 41 mp 80.0–84.0 ºC). $^1$H NMR: $\delta$ 4.02 (s, 3H), 6.89 (d, $J = 2.4$ Hz, 1H), 7.44 (dq, $J = 2.4$, 0.3 Hz, 1H). $^{13}$C NMR: $\delta$ 40.42, 103.14, 132.64, 155.37. Anal. Calcd for C$_4$H$_5$N$_3$O$_2$ (127.10): C, 37.80; H, 3.97; N, 33.06. Found C, 38.16; H, 3.79; N, 32.79.

3,5-Dimethyl-4-nitro-1$^1$H-pyrazole (15). Brownish needles (76%), mp 122.0–123.0 ºC (lit.43 mp 126.0–127.0 ºC). $^1$H NMR: $\delta$ 2.46 (s, 6H); $^{13}$C NMR: $\delta$ 12.69, 130.04, 143.46. Anal. Calcd for C$_5$H$_7$N$_3$O$_2$ (141.13): C, 42.55; H, 5.00; N, 29.77. Found C, 42.67; H, 5.02; N, 29.43.

1-Methyl-4-nitro-1$^1$H-imidazole (17a). White prisms (39 %), mp 133.0–134.0 ºC (lit.48 mp 134 ºC). $^1$H NMR: $\delta$ 3.83 (s, 3H), 4.72 (br d, $J = 1.5$ Hz, 1H), 7.78 (d, $J = 1.5$ Hz, 1H); $^{13}$C NMR: $\delta$ 34.55, 120.19, 136.61, 148.00. Anal. Calcd for C$_4$H$_5$N$_3$O$_2$: C, 37.80; H, 3.97; N, 33.06. Found C, 38.16; H, 3.83; N, 32.86.

1-Methyl-5-nitro-1$^1$H-imidazole (17b). Orange prisms (22 %), mp 59.0-60.0 °C (lit.33 mp 60.0 °C). $^1$H NMR: $\delta$ 4.02 (d, $J = 0.6$ Hz, 3H), 7.59 (br s, 1H), 7.98 (d, $J = 1.1$ Hz, 1H); $^{13}$C NMR: $\delta$ 34.55, 120.19, 136.61, 148.00. Anal. Calcd for C$_4$H$_5$N$_3$O$_2$: C, 37.80; H, 3.97; N, 33.06. Found C, 38.16; H, 3.83; N, 32.86.

1,2-Dimethyl-4-nitro-1$^1$H-imidazole (19a). White needles (53 %), mp 182.0–184.0 ºC (lit.50 mp 184 ºC). $^1$H NMR: $\delta$ 2.39 (s, 3H), 2.47 (s, 3H), 8.54 (s, 1H), 8.87 (s, 1H); $^{13}$C NMR: $\delta$ 12.85, 33.74, 120.71, 146.10, 145.07.

1,2-Dimethyl-5-nitro-1$^1$H-imidazole (19b). White prisms (18 %), mp 134.0–135.0 ºC (lit.66 mp 134.0–135.0 ºC). $^1$H NMR: $\delta$ 2.39 (s, 3H), 2.47 (s, 3H), 8.54 (s, 1H), 8.87 (s, 1H); $^{13}$C NMR: $\delta$. 13.70, 32.90, 131.89, 149.98.

4-Nitroisoxazole (21a). Yellow prisms (73 %), mp 45.0–46.0 ºC (lit.57 mp 46.0–47.0 ºC). $^1$H NMR: $\delta$ 8.85 (s, 1H), 9.32 (s, 1H); $^{13}$C NMR: $\delta$ 144.44, 157.84. Anal. Calcd for C$_3$H$_2$N$_3$O$_3$ (114.06): C, 31.59; H, 1.77; N, 24.56. Found C, 31.63; H, 1.55; N, 24.31.

5-Methyl-4-nitroisoxazole (21b). Yellow oil (64 %), (lit.57 bp 88.0–90.0 / 18 Torr). $^1$H NMR: $\delta$ 2.87 (d, $J = 0.7$ Hz, 3H), 8.76 (q, $J = 0.7$ Hz, 1H); $^{13}$C NMR: $\delta$ 12.97, 131.08, 145.88, 170.66.

3,5-Dimethyl-4-nitroisoxazole (21c). Yellowish prisms (72 %), mp 63.0-64.0 °C (lit.⁵⁵ mp 63.0-64.0 °C). ¹H NMR: δ 2.56 (s, 3H), 2.82 (s, 3H); ¹³C NMR: δ 11.49, 13.81, 130.14, 155.50, 171.89.

2,5-Dimethyl-4-nitro-1,3-thiazole (23). Brownish prisms (67 %), mp 55.5–56.5 °C (lit.⁶⁰ mp 56.5 °C). ¹H NMR: δ 2.71 (s, 3H), 2.79 (s, 3H); ¹³C NMR: δ 13.10, 19.08, 138.36, 150.84, 161.29. Anal. Calcd for C₅H₆N₂O₂S (158.18): C, 37.97; H, 3.82; N, 17.71. Found C, 38.08; H, 3.74; N, 17.54.
