Abstract
Racemic 1,2,3,6,7,8,11,12,13-nonamethoxy-10,15-dihydro-5H-tribenzo[a,d,g]cyclononene was prepared via trimerization of 3,4,5-trimethoxybenzyl alcohol catalyzed by Lewis acids such as AlCl₃, ZnCl₂, FeCl₃ and SnCl₄ in chlorinated solvents. The reaction proceeded smoothly in dichloromethane with SnCl₄ as catalyst and gave 54% yield. Some open chain oligomers were also obtained.

Keywords: Cyclotriveratrylene, trimerization, 3,4,5-trimethoxybenzyl alcohol, Lewis acid

Introduction

Functionalized cyclotriveratrylenes (CTV), also referred as tribenzocyclononene (TBCN), have attracted much attention because of their rigid cone shaped frame and chiroptical properties. 1-2 1,2,3,6,7,8,11,12,13-Nonamethoxy-10,15-dihydro-5H-tribenzo[a,d,g]cyclononene (NDTC) was first isolated when Bosh attempted to couple 3,4,5-trimethoxybenzylmagnesium chloride and 1,3,4-trimethylpyridium iodide. 3 This molecule exhibits C₃ symmetry and is chiral (Figure 1). 4 The resolution of racemic NDTC has not been reported, but the structure was determined by X-ray crystallographic analysis and the racemic mixture was discriminated by ¹H-NMR using chiral shift reagents. 4,5 NDTC is usually prepared by trimerization of 3,4,5-trimethoxybenzyl alcohol in the presence of H₂SO₄ (aq.) 1 or bentonite-clay 6 with yields less than 12%.
Figure 1. Structure of NDTC.

Figure 2. Compounds derived from 3,4,5-trimethoxybenzyl alcohol in the presence of AlCl₃.

Results and Discussion

In our attempt to couple 3,4,5-trimethoxybenzyl acetate and benzoyl chloride in the presence of AlCl₃ in CH₂Cl₂, NDTC was obtained in 20% yield. Under the same reaction conditions, methyl 3,4,5-trimethoxybenzyl ether or benzyl 3,4,5-trimethoxybenzyl ether could also be cyclized to NDTC. When 3,4,5-trimethoxybenzyl alcohol was used directly, NDTC and some other compounds such as 2, 3, 4 and 5 were obtained (Figure 2). The reaction may proceed through the
intermediate generated from benzyl alcohol with AlCl₃, leading to 2, 3, 4, 5 and eventually NDTC.

Further study indicated that 2 equivalent AlCl₃ is optimal for the synthesis of NDTC, whereas the yields are not significantly different at 20°C 10 °C, 0 °C or - 10 °C and - 20 °C. Many other Lewis acids, such as ZnCl₂, FeCl₃ and SnCl₄ could catalyze the trimerization. SnCl₄ gave the highest yield (54%) (Table 1). TiCl₄ did not catalyze the trimerization and gave 3,4,5-trimethoxybenzyl chloride as major product in a yield of 60%.

*Carried out at rt. with 2 eq. SnCl₄. The reaction was quenched with water when the alcohol had been consumed.

SnCl₄ was selected to investigate the effect of solvents. The results showed that chlorinated solvents are suitable for the reaction except CH₃CCl₃ (Table 2.)
Experimental Section

**General Procedures** Melting points were determined using an XRC-1 melting point apparatus (Sichuan University Science Instruments Factory) and are uncorrected. IR spectra were carried out on a Perkin Elmer Spectrum One spectrometer. Mass spectra were obtained on a Finnigan -LCQ\textsuperscript{DECA} mass spectrometer (ESIMS) and VG7070E mass spectrometer (EIMS). NMR spectra were recorded on a Bruker Avance 600 spectrometer with TMS as internal standard. 3,4,5-Trimethoxybenzyl alcohol was synthesized from reduction of methyl 3,4,5-trimethoxybenzoate with LiAlH\textsubscript{4} in 85% yield.\textsuperscript{7} All commercial reagents were purified according to the reported procedures\textsuperscript{8} prior to use.

**General procedure for the synthesis of NDTC**

To the solution of 3, 4, 5-trimethoxybenzyl alcohol (198 mg, 1 mmol) in 20 ml solvent was added 2.0 equivalent Lewis acid. The mixture was stirred at room temperature until completion (about 0.5 h, monitored by TLC). The reaction mixture was then poured into ice water, the aqueous layer was separated and extracted with chloroform (2\times10 ml). The organic layers were combined and washed successively with 1 mol/L HCl, water and brine, dried over anhydrous MgSO\textsubscript{4}. After filtration, the solvent was removed in vacuum and the residue was subjected to silica gel column eluted with petrol/ethyl acetate (10:1) to give NDTC. NDTC was obtained as colorless needles after recrystallization from ethyl acetate.
