Abstract
We report a short and efficient synthesis of 1,2,3-triazole and bis-1,2,3-triazoles acyclonucleoside analogues of Acyclovir. A series of novel 1,2,3-triazole acyclonucleosides linked to nucleobases were prepared via copper(I)-catalyzed 1,3-dipolar cycloaddition of N-9 propargylpurine, N-1-propargylpyrimidines or N-1-propargylindazoles with the azido-pseudo-sugar under Microwave-assisted synthesis followed by treatment with K₂CO₃/MeOH.

Keywords: 1,3-Dipolar cycloaddition, 1,2,3 triazole, 1,2,3-bis-triazoles, acyclovir, microwave

Introduction
Triazole heterocycles are found to be potent antimicrobial, antiviral, and anti-proliferative agents. The pharmaceutical importance of triazoles has prompted the design and synthesis of various triazolonucleosides (Figure 1). Ribavirin 1 was the first synthetic triazole nucleoside analogue found to show antiviral activity against many viruses and is still the only small-molecular-weight drug available for treating viral infections caused by hepatitis C virus (HCV). In addition, 1,2,3 triazole TSAO [2’,5’-bis-O-(tert-butyldimethylsilyl)-β-D-ribofuranosyl]-3’-spiro-5’’-(4’’-amino-1’’’,2’’’-oxathiole-2’’’, 2-dioxide) 2 analogues exhibited an anti-HIV activity. Moreover, recent studies have disclosed a series of 1,2,3-bis-triazoles as potent HIV-1 protease inhibitors for the inhibition of viral replication. Since the discovery of acyclovir [9-((2-hydroxyethoxy) methyl)guanine ACV (Zovirax)] 3 as the highly selective antiviral drug for the
treatment of herpes simplex (HSV)\(^5\) virus infections and Varicella-Zoster 1, several acyclonucleosides were synthesized and tested.

![Figure 1. Structure of Ribavirin 1, TSAO analogue 2 and Acyclovir 3.](image)

In view of the biological importance of 1,2,3-triazoles and acyclovir, it was of considerable interest to develop a rapid, facile and practical protocol for the formation of compounds incorporating ring systems. In connection to our previous studies on the synthesis of acyclonucleosides, we report here a regioselective synthesis of 1,2,3-triazoles and bis-1,2,3-triazole acyclonucleosides analogues of ACV in which the heterocyclic base is linked to a (2-hydroxyethoxy)methyl via a methylene-1,2,3-triazole group. In this paper, we report an efficient approach for the one-pot synthesis of 1,4-disubstituted-1,2,3-triazoles analogues of ACV from propargylated bases and azido-pseudosugar under CuI catalysis.

**Results and Discussion**

The most widely used methods for the synthesis of triazoles is the Huisgen 1,3-dipolar cycloaddition of alkynes with organic azides. This route to triazoles is often conducted at high temperature for a prolonged period of time, and usually leads to a mixture of 1,4-disubstituted and 1,5- disubstituted 1,2,3-triazoles.\(^7\) Copper-catalyzed click chemistry involving azides and terminal acetylenes has enabled practical and efficient preparation of 1,4-disubstituted-1,2,3-triazoles, from a wide range of substrates with excellent selectivity.\(^8-13\) We decided to explore the feasibility of the “click”chemistry for the synthesis of novel 1,2,3-triazole acyclonucleosides with different heterocyclic bases connected via a flexible methylene linker. At first, several attempts were made in order to optimize the reaction conditions.

The synthetic approach to 1,4-disubstituted-1,2,3-triazoles analogues of ACV involved first the preparation of the known [(2-acetoxyethoxy)methyl]azide 6 from the [(2-acetoxyethoxy)methyl]bromide 2 and sodium azide at 90-95°C for 4h (Scheme 1).\(^7\)
Scheme 1. Synthesis of the known azide 6 from bromide 5 and sodium azide.

The second step of the synthesis was the preparation the propargylated nucleobases. For this, uracil, thymine and iodouracil, were used as starting materials which were treated with propargylbromide in the presence of K$_2$CO$_3$. All reactions were carried out in DMF, as it is an excellent solvent for dissolving nucleobases$^7$ (Scheme 2). The pyrimidine derivatives were exclusively alkylated at the N-1 position, 8a-c as confirmed by $^1$H NMR spectra.

Scheme 2. N-1-alkylation of heterocyclic bases 7a-7c with propargylbromide.

Next, the terminal triple bonds of propargylated nucleobases were ligated to the azide residue of the pseudosugar using the copper(I)-catalyzed 1,3-dipolar cycloaddition in water-acetonitrile and Et$_3$N at room temperature leading to the 1,4-disubstituted regioisomer within 3h (method A)$^{14}$ (84 and 86% yields). In order to obtain these triazole acyclonucleosides in higher yields with shorter reaction times under mild reaction conditions, we turned our attention to microwave irradiation. The use of microwave-assisted organic synthesis has attracted considerable interest over the last two decades, leading often to remarkable decreases in reaction times, significant enhancements of yields, easier workups and better regioselectivity.$^{15}$
Scheme 3. Reagents and conditions: Method A: CuI, Et₃N, H₂O/CH₃CN, RT. Method B: 1) MW, CuI, Et₃N; 2) MeOH/ K₂CO₃.

Herein, we report a rapid, facile and practical protocol for the formation of the triazole ring. The cycloaddition of propargylated nucleobases and azide carried out under microwave conditions with CuI as catalyst and without solvent lead to the desired products in a quantitative yield and reaction time of one minute (Scheme 3) (Method B). Consequently, Method B was selected as the best practical protocol for the synthesis of triazole acyclonucleosides, because it gave the best results.

Method A: In water at room temperature.
Method B: under microwave
To extend the general applicability of the microwave assisted click reaction, for the synthesis of triazole acyclonucleosides of purines and modified nucleobases.

\[ \text{Scheme 4. Reagents and conditions: (i) } K_2CO_3, \text{ DMF. (ii) 1) CuI, Et}_3N, \text{ MW; 2) MeOH/ K}_2CO_3. \]  

\[ \text{N-9-propargyladenine, N-9-Propargyl-N-2-acetylguanine, N-1-propargyl-3-chloro and N-1-propargyl-3-bromoindazole were prepared by using the same reaction conditions discussed above. Using the copper(I)-catalyzed 1,3-dipolar cycloaddition under click reaction conditions the desired products were obtained in a quantitative yield and reaction time of only one minute (Scheme 4).} \]

With this promising procedure in hand, we extended the scope of substrates to include other alkynyle derivatives, as outlined in Scheme 5. Analogously to the preparation of N-1-propargylated pyrimidine, the N-1, N-3-bis-propargylated pyrimidines were prepared from starting material N-1-propargylated uracil, thymine and 5-iodouracil (Scheme 5), (Yields 80-88%). The bis-propargylated pyrimidines were converted into the bis-triazoles acyclonucleosides using the same reaction conditions in quantitative yield.
Scheme 5. Reagents and conditions: (i) K₂CO₃, DMF. (ii) 1) CuI, Et₃N, MW; 2) MeOH/K₂CO₃

Using the copper(I)-catalyzed 1,3-dipolar cycloaddition under click reaction conditions the bis-propargyl-5-iodouracil 14c unexpectedly leads to bis-triazolouracil 15a in a quantitative yield and reaction time of one minute. This structure was established on the basis of ¹H, ¹³C NMR spectra, mass spectrum and comparison with the spectroscopic data of 15a. This transformation can best be explained by a deiodination of N-1, N-3-bis-alkylated 5-iodouracil in the presence of CuI.

The structure of all compounds was confirmed on the basis of ¹H, ¹³C NMR spectra and mass spectra. The formation of 1,4-disubstituted triazoles was unequivocally established through the characteristic chemical shift value of the triazolyl proton (5-CH) at δ = 8.07-8.54 ppm. The triazole ring formation can also be identified from the 13C-spectra with the new signals of the olefinic C-atoms of the 1,2,3-triazole moiety at (δ(C5) = 122.5-125 ppm) and (δ(C4) =140-144 ppm).

Conclusions

In summary, we report a short and efficient synthesis of 1,2,3-triazole and bis-1,2,3-triazoles acyclonucleoside analogues of ACV. We accomplished a straightforward convenient methodology for the synthesis of novel 1,2,3-triazole nucleosides using the Cu(I)-catalyzed alkyne-azide cycloaddition reaction. These products are under investigation for their biological activities.

Experimental Section

General. Melting points were determined in open capillary tubes and are uncorrected. NMR spectra were recorded at 300 MHz (\(^1\)H, \(^{13}\)C) Bruker in (DMSO-d\(_6\), CDCl\(_3\)) using TMS as an internal reference. All chemical shifts (\(\delta\)) are expressed in parts per million and coupling constant (\(J\)) are given in Hertz; T (1,2,3-triazole) and B (heterocyclic base). Mass spectra were obtained by using ESI/MS and (FAB\(^+\)). Reactions were performed in a domestic microwave oven Model AVM510/ WP/WH. DMF and MeCN were distilled prior to use and stored over molecular sieves 4A. Precoated Merck Silica Gel 60F-254 plates were used for thin layer chromatography (TLC) and the spots were detected under UV light (254 nm). Column chromatography (CLC) was performed using silica gel (0.063-0.2 mm) Fluka. All reagents used were purchased from Aldrich.

[(2-Acetoxyethoxy)methyl]bromide\(^7\) 5. To 106 mmol (13 g) of distilled acetyl bromide, was added 100 mmol of 1,3-dioxolane drop wise while agitating and cooling by a bath of ice. The reaction is fast and exothermic. After the addition, the reaction is agitated further during 30 min at room temperature. Afterwards the reaction mixture was distilled under reduced pressure. \(^1\)H NMR, CDCl\(_3\), \(\delta\) 2.1 (s, 3H, CH\(_3\)COO), 3.88 (t, 2H, OCH\(_2\)), 4.27 (t, 2H, CH\(_2\)O), 5.72 (s, 2H, OCH\(_2\)Br).

[(2-acetoxyethoxy)methyl]azide\(^7\) 6. To a solution of 10 mmol (2g) of [(2-acetoxyethoxy)methyl]bromide in 60 ml of anhydrous DMF is added 15 mmol (0.9g) of sodium azide (\(\text{NaN}_3\)). The mixture was brought up to a temperature of 90-95°C during 4h. After cooling, the solution was extracted with ether (2 x 50 ml) then washed with brine, and dried (MgSO\(_4\)). After removal of the solvent under reduced pressure, the residual oil was purified on a silica gel column with hexane (95 %). \(^1\)H NMR, CDCl\(_3\), \(\delta\) 2.1 (s, 3H, CH\(_3\)COO); 3.8 (t, 2H, OCH\(_2\)); 4.2 (t, 2H, CH\(_2\)O); 4.65 (s, 2H, OCH\(_2\)N\(_3\)).

General procedure for the synthesis of the monopropargyl heterocyclic bases\(^7\)

The mixture of 1 mmol of the heterocyclic base (thymine, uracil, iodouracil, adenine, N-2acetylguanine, 3-bromo-6-nitroindazole or 3-chloro-6- nitroindazole), 0,5 mmol of \(\text{K}_2\text{CO}_3\) and 1 mmol of propargylbromide in 20 ml of anhydrous DMF was stirred at room temperature
during 24h. After removal of the solvent under reduced pressure the residue obtained was purified on silica gel column CH\textsubscript2Cl\textsubscript2 and MeOH (99/1).

N-1,N-3-Dipropargylthymine 14c. (88%). Solid, mp 123 –126 °C, ¹H NMR, DMSO-d₆, δ 3.14 ( t, 1H, CH); 3.45( t, 1H, CH); 4.55 (m , 4H, 2x(CH₂N)); 8,33 ( d, 1H, H-6, J = 7.8 Hz), ¹³C NMR, DMSO-d₆: 31.46; 38.19; 67.50; 73.43; 76.31; 78.06; 78.58; 147.77; 149.47; 158.99.

General procedure for the synthesis of the triazole acyclonucleoside derivatives

The synthesis of the 1,2,3-triazole derivatives was carried out by two methods:

**Method A.** To a solution of 5 mmol of the alkylazide in 10 ml of water/acetonitrile (v/v) was added 1 mmol of N-propargylbase, 1mmol Et₃N and 0,1mmol of CuI for 3h at room temperature. The reaction mixture was diluted with 25 mL of water, cooled in ice, and extracted with CH₂Cl₂ (3 x 15 ml). The combined organic extracts were washed with brine, and dried (MgSO₄). After removal of the solvent under reduced pressure, the acetyl groups of the protected nucleosides were then cleaved using 2 mmol of K₂CO₃ in 10 ml of methanol, and the reaction mixture was stirred for 3 h at room temperature. When TLC analysis showed no more starting material, solvent was removed by rotary evaporation, and the residue was purified on silica gel with dichloromethane and methanol to give the desired compound.

**Method B.** the mixture of alkylazide (5 mmol), Et₃N (1 mmol), N-propargylbase (1 mmol) and 0,1mmol of CuI were irradiated in the microwave oven at power level (300 W) for 1 min without solvent. K₂CO₃ (2 mmol) in 10 ml of methanol were added directly to reaction mixture. The mixture was stirred for additional 3h at room temperature. When TLC analysis showed no starting material, solvent was removed under reduced pressure, and the residue was purified on silica gel with dichloromethane and methanol.
