Abstract
An efficient method for the synthesis of 6-(aryltio)phenanthridines by tert-butyl peroxybenzoate (TBPB)-promoted cyclization reaction of 2-isocyanobiphenyls with thiols is developed. A radical pathway is proposed and evidenced for the reaction mechanism. It tolerates a wide range of substrates and represents a practical approach to 6-arlythiophenanthridines.

Keywords: Phenanthridines, thiols, isocyanides, cyclization, radical reactions

Introduction
Phenanthridines are common constituents of some alkaloids and potential pharmaceuticals (Figure 1), and these heterocycles show biological activities,\textsuperscript{1-5} such as antitumor, antileukemic, antiviral, and antifungal properties.\textsuperscript{6-11} In addition, they have excellent optical and electronic properties in the fields of functional materials.\textsuperscript{12,13}

In recent years, the synthesis of phenanthridine derivatives via the radical addition and cyclization of 2-isocyanobiphenyls has received much attention. Several radical precursors have been used, such as boronic acids,\textsuperscript{14} CF\textsubscript{3} reagents,\textsuperscript{15-17} aldehydes,\textsuperscript{18} acyl peroxides,\textsuperscript{19} simple alkanes,\textsuperscript{20} halides,\textsuperscript{21,22} diphenylphosphine oxide,\textsuperscript{23} arenesulfonfyl chlorides,\textsuperscript{24} \(\alpha\)-oxocarboxylic acids and hydrazines,\textsuperscript{25,26} and as a result the corresponding 6-functionalized phenanthridine derivatives were prepared. However, only a few examples of the construction of 6-arylthio-substituted phenanthridines have been reported. The formation of 6-arylthiophenanthridines from 2-isocyanobiaryls and disulfides was first described by Han and Pan.\textsuperscript{27} However, this method requires a large excess (6 equiv) of peroxide and non-atom economic disulfides. And 6-arylthiophenanthridines can be obtained by the reaction of 2-biaryl isothiocyanates and diarylidiuonium salts, which are costly.\textsuperscript{28} In addition, they can also be obtained from the nucleophilic substitution of 6-chlorophenanthridines with thiophenols.\textsuperscript{29,30} Methods for the
construction of 6-aryltiphienanthridines are still desired. To this end, we report the radical addition and cyclization of 2-isocyanobiphenyls with thiophenols to prepare 6-aryltiphienanthridines.

**Results and Discussion**

Initially, 2-isocyno-4'-methoxybiphenyl (1a) and p-toluenethiol (2a) were selected as model substrates for optimization of the reaction conditions (Table 1). When a mixture of 1a and 2a with t-BuOK was heated at 120 °C in xylene for 5 h under argon, no product was obtained (Table 1, entry 1). The addition of azobisisobutyronitrile (AIBN) provided the product 3a, although in only 19% yield (entry 2). Several other radical initiators were then examined. Phthaloyl peroxide, 2,3-dichloro-5,6-dicyano-1,4-benzoquinone (DDQ) and Na2S2O8 did not give the required product (Table 1, entries 6, 8 and 9). Interestingly, benzoyl peroxide (BPO), t-butyl peroxide (DTBP) and dicumyl peroxide (DCP) all promoted the reaction, in 29%, 30% and 33% yields respectively, while tert-butyl peroxybenzoate (TBPB) afforded a 53% yield (entries 3-7). Therefore, TBPB was chosen for further study. We found that an increase in the amount of TBPB slightly decreased the yield (Table 1, entry 10).

A base is also essential for this reaction. Without a base, 3a was obtained in only 34% yield (Table 2, entry 1). Improved yields were observed when inorganic bases such as K2CO3, Cs2CO3 and NaOH were used (Table 2, entries 2-4). When organic bases were examined, DBU and NEt3 were found to be unfavorable (Table 2, entries 5 and 6), while t-BuOK and MeONa gave
moderate yields (Table 2, entries 8 and 9). Further increase of the amount of base resulted in a decrease in the yield (Table 2, entry 10).

Furthermore, the effect of solvents was explored. Solvents also play an important role in the reaction. When the reaction was carried out in polar solvents, such as DMF, DMSO and NMP, the yield of the desired product decreased dramatically (Table 2, entries 11-13). Toluene and chlorobenzene gave similar yields compared with xylene (Table 2, entries 15 and 16).

After the establishment of the optimal reaction conditions, various thiophenols and also ethylthiol were tested for this oxidative thiolation / cyclization reaction with 2-isocyno-4'-methoxybiphenyl. As is evident from Table 3, <i>ortho</i> and <i>para</i> substituents on thiophenol ring did not have any significant influence on the yield of the reaction (45%-68% for 3a-3d, Table 3, entries 1-4). However, fluorine substitution decreased the yield to 30% (Table 3, entry 5). Not only could thiophenols give moderate yields, but also ethylthiol gave a yield of 45% (Table 3, entry 6).

<sup>a</sup> Reaction conditions: 2-isocyno-4'-methoxy-biphenyl (0.3 mmol), R<sup>1</sup>-SH (0.36 mmol), TBPB (0.9 mmol), MeONa (0.3 mmol), solvent (3 mL), 120 °C for 5 h under nitrogen. <sup>b</sup> Isolated yield.

A broad range of 2-isocyanobiphenyls were then investigated under standard reaction conditions; the results are summarized in Table 4. The electronic effect of the substituents on the
aromatic ring with the isocyano group was unnoticeable. The functional groups, such as acetyl, ester, cyano, t-butyl, fluorine and chlorine were all tolerated well, and the desired products were obtained in moderate yields (Table 4, entries 1-7). Next, a variety of substituted thiophenols were subjected to the reaction. Once again, 4-bromo thiophenol, thiophenol, 3-methoxybenzene-thiol, 4-toluene-thiol, 2-naphthalene-thiol and 4-fluorothiophenol worked well, providing the desired products in moderate yields. In addition, reactions with different isocyanides also proceeded smoothly, which furnished the desired product 3n, 3o, 3q, 3r, 3s and 3t in 41%, 55%, 29%, 40%, 41% and 60% yields, respectively. To investigate the regioselectivity of the cyclization, 2-isocyanobiphenyl bearing a m-methoxy (Table 4, entry 15) was investigated, which resulted in a mixture of two regioisomers in a ratio of 3:2. Gratifyingly, 3-(2-isocyanophenyl)pyridine gave the corresponding products in 79% yield and 3:2 regioselectivity (Table 4, Entry 16).

To probe the mechanism, the control experiment with the radical scavenger was carried out (Scheme 1). When the radical scavenger (2,2,6,6-tetramethylpiperidin-1-yl)oxyl (TEMPO) was added to the reaction mixture, none of the desired product was detected (Scheme 1 a). This result provides evidence for a free radical mechanism. The reaction did not proceed in the absence of TBPB (Table 1, entry 1), which indicated that TBPB plays the role of reaction promoter. In addition, we performed the reaction of 2-isocyano-4′-methoxybiphenyl (1a) with 1,2-diphenyldisulfane under the standard conditions, only giving a 30% yield (Scheme 1 b). So we excluded the possibility that thiophenol was oxidized to 1,2-diphenyldisulfane on the major pathway in the reaction. Accordingly, a possible mechanism is illustrated in Scheme 2. Firstly, the homolytic cleavage of TBPB produces a t-butoxy radical (A) and a benzoate radical (B) which abstracts the S-H-atom from the thiophenol to give thiophenyl radical (C). Then, addition of the radical species (C) to the isonitrile produces another radical intermediate (D). Subsequently, intermediate (D) cyclizes to generate the cyclohexadienyl radical (E). Further reaction of the radical E has two plausible directions. One is further oxidation by the benzoate radical or t-butoxy radical to give the intermediate (F), and then the phenanthridine (G) is delivered after deprotonation. The other is that the benzoate radical or the t-butoxy radical will abstract the H-atom from the intermediate (E), resulting in the product (G).

**Scheme 1.** The control experiments for the mechanism.
Scheme 2. Proposed mechanism for the phenanthridine formation.

In conclusion, we have developed a TBPB-promoted phenanthridinylation of simple thiol sources with 2-isocyanobiphenyls. A radical pathway was proposed and evidenced for the reaction mechanism. The functional group, such as acetyl, ester, cyano, t-butyl, fluorine and chlorine were all tolerated well, and the desired products were obtained in moderate yields. This represents a practical approach to access 6-arylthiophenanthridines.

Experimental Section

General. Melting points were measured on a Novel X-5 melting point instrument. All $^1$H NMR (400 MHz) and $^{13}$C NMR (125 Hz) spectra were measured in CDCl$_3$ and recorded on Bruker Avance II 400 ($^1$H NMR) or Bruker Avance III 500 ($^{13}$C NMR) spectrometer with chemical shifts reported as ppm (with TMS as an internal standard). For chromatography, neutral aluminum oxide or silica gel was employed. HRMS were conducted on GCT mass spectrometer (EI) or a LTQ Orbitrap XLTM spectrometer in positive electrospray ionization (ESI+) mode. 2-isocyanobiphenyls (1) were synthesized via a three step route according to the paper previously.$^{17}$ The newly synthesized 6-arylthiophenanthridines compounds are described below.

General procedure for thiolation of isocyanide and intramolecular radical aromatic cyclization reaction

To a Schlenk tube were added 2-isocyanobiphenyls 1 (0.30 mmol), thiols 2 (0.36 mmol), xylene (3 mL), TBPB (0.9 mmol), then the tube was charged with nitrogen, and was stirred at 120 °C for 5 h. After the reaction was finished, the reaction mixture was diluted in 20 mL ethyl acetate, washed with a saturated solution of brine (15 mL×3), dried with anhydrous sodium sulfate and concentrated in vacuum, and the resulting residue was purified by neutral aluminum oxide (200–300 mesh) or silica gel (200–300 mesh), chromatography to afford the product 6-arylthiophenanthridines 3.

8-Methoxy-6-[(p-tolylthio)phenanthridine (3a). White solid; yield 53%, 52 mg; mp: 155–156 °C. 1H NMR (400 MHz, CDCl3) δH 8.42 (1H, d, 3JHH 9.0 Hz, ArH), 8.34 – 8.31 (1H, m, ArH), 7.82 – 7.74 (2H, m, ArH), 7.57 – 7.45 (4H, m, ArH), 7.40 (1H, dd, 3JHH 9.0 Hz, 4JHH 2.6 Hz, ArH), 7.23 (2H, d, 3JHH 8.0 Hz, ArH), 3.94 (3H, s, OCH3), 2.40 (3H, s, CH3). 13C NMR (125 MHz, CDCl3) δC 158.8, 158.2, 143.3, 138.6, 134.9, 129.8, 129.3, 127.6, 126.9, 126.7, 126.2, 124.1, 123.3, 121.5, 121.5, 105.8, 55.6.

8-Methoxy-6-(phenylthio)phenanthridine (3b). White solid; yield 58%, 55 mg; mp: 81–82 °C (lit.27 mp: 81–82 °C). 1H NMR (400 MHz, CDCl3) δH 8.49 (1H, d, 3JHH 9.1 Hz, ArH), 7.40 – 7.38 (1H, m, ArH) 7.81 – 7.77 (2H, m, ArH), 7.66 – 7.64 (2H, m, ArH), 7.54 – 7.53 (2H, m, ArH), 7.45 – 7.41 (4H, m, ArH), 3.98 (3H, s, OCH3).

6-[(3-methoxyphenyl)thio]phenanthridine (3c). White solid; yield 45%, 47 mg; mp: 114 – 115 °C. 1H NMR (400 MHz, CDCl3) δH 8.50 (1H, d, 3JHH 9.0 Hz, ArH), 8.40 (1H, d, 3JHH 9.5 Hz, ArH), 7.86 (1H, d, 3JHH 9.5 Hz, ArH), 7.78 (1H, d, 3JHH 2.6 Hz, ArH), 7.58 – 7.53 (2H, m, ArH), 7.47 (1H, dd, 3JHH 9.0Hz, 4JHH 2.7 Hz, ArH), 7.32 (1H, t, 3JHH 7.9 Hz, ArH), 7.24 – 7.22 (2H, m, ArH), 6.94 (1H, d, 3JHH 9.2 Hz, ArH), 3.98 (3H, s, OCH3), 3.81 (3H, s, OCH3).

13C NMR (125 MHz, CDCl3) δC 159.8, 158.8, 157.6, 143.3, 132.1, 129.6, 129.4, 127.7, 127.1, 126.4, 124.1, 123.5, 121.7, 121.5, 119.3, 114.6, 106.0, 55.6, 55.4. HRMS (ESI): [M + H]+ calcd for [C21H17NO2S]+ 348.1053; found, 348.1054.

6-[(4-Bromophenyl)thio]-8-methoxyphenanthridine (3d). Orange solid; yield 68%, 80 mg; mp: 178 – 179 °C. 1H NMR (400 MHz, CDCl3) δH 8.46 (1H, d, 3JHH 9.0 Hz, ArH), 8.36 (1H, d, 3JHH 9.0 Hz, ArH), 7.79 (1H, d, 3JHH 7.2 Hz,), 7.70 (1H, s, ArH), 7.56 – 7.50 (6H, m, ArH), 7.44 (1H, dd, 3JHH 9.0 Hz, 4JHH 2.5 Hz, ArH), 3.97 (3H, s, OCH3). 13C NMR (125 MHz, CDCl3) δC 158.9, 157.1, 143.2, 136.3, 132.1, 129.7, 129.3, 127.8, 127.0, 126.5, 124.2, 123.4, 121.7, 121.5, 105.6, 55.6.
