Abstract
Novel pyrano[4,3-b]pyran-5-one derivatives have been obtained efficiently in a multicomponent domino cyclisation via the one-pot three-component reaction of aromatic aldehyde, 4-hydroxy-6-methyl-2-pyrone and N-methyl-1-(methylthio)-2-nitroethenamine in ethanol under microwave irradiation. The combined methods show excellent advantages such as higher yield, shorter reaction time and cleaner reaction, compared with conventional heating methods. The synthesized compounds are confirmed by 1H NMR, 13C NMR, IR and ESI-MS.

Keywords: Pyrano[4,3-b]pyran-5-one, one-pot synthesis, multicomponent domino reaction, microwave irradiation

Introduction

The pyranopyran derivatives are an important class of heterocycle with a wide range of biological properties.1-4 Moreover, they possess important medicinal properties, such as antiproliferative,5 anti-inflammatory,6 antiviral7 and anticancer.8 Some of the pyranopyran derivatives were reported to be used as the drugs, as shown in Figure 1.9-11

The development of new methodologies for the synthesis of pyranopyran is still a subject of considerable interest to synthetic and medicinal chemists. Consequently, a number of synthetic strategies for the construction of pyranopyran derivatives have been reported.12-16 However, the conventional multistep methods for the preparation of complex compounds result in synthetic inefficiency and the generation of large amounts of wastes because of complicated synthetic operations including extraction and purification in every step. Furthermore, many preparations of these compounds require long reaction times,17-18 harsh reaction conditions,19 and/or expensive catalysts or reagents.20 With the increasing requirement for new compounds for drug discovery
in the fields of combinatorial medicinal chemistry, speed is very important to prepare novel compounds with the different structures. Thus, microwave-assisted organic synthesis approach is widely applied to achieve desired products because of shorter reaction times, high reaction selectivity and efficiency, compared with the classical approach.\textsuperscript{21-22} In addition, multi-component reactions (MCRs) have attracted considerable attention from synthetic organic chemists for the construction of complex compounds because they represent an attractive synthetic strategy for rapid and efficient generation of compound libraries.\textsuperscript{23-24} MCRs can readily achieve high levels of diversity by simply changing the reacting components.\textsuperscript{25} Specially, one-pot multi-component condensation via domino reaction supplies a possible route for an ideal synthesis, enabling the synthesis of complex molecules with maximum simplicity.\textsuperscript{26}

\begin{center}

\end{center}

\textbf{Figure 1.} Pyranopyran and chromene derivatives having biological activities.\textsuperscript{9-11}

The reactant \textit{N}-methyl-1-(methylthio)-2-nitroethenamine (NMSM) contains four active sites with three functional groups on an ethene motif, as shown in Figure 2. With a strongly electron-withdrawing nitro group, the nitroethylene substructure is a good Michael acceptor. The methylthio group is a good leaving group, and the methylamino group acts as electron donor, which makes the C2 a good Michael donor. Furthermore, So the compound of NMSM as an important reactant may cause the products more valuable as medical intermediate because the compound has two active groups of nitro and secondary amine compared with the other reactants.\textsuperscript{27-28} Overall, the ethylene moiety is a polarized push-pull alkene with C1 showing electrophilic character and C2 showing nucleophilic character.
Accordingly, we aimed to carry out an efficient and facile synthesis of pyranopyran derivatives by one-pot MCRs under microwave irradiation in a domino reaction. In this paper we report that the three components of aromatic aldehydes (1), NMSM (2) and 4-hydroxy-6-methyl-2-pyrone (3) or 4-hydroxy-coumarin (5) can be used to produce novel pyranopyran derivatives (4, 6) in ethanol in the presence of ammonium acetate, as shown in Scheme 1. Besides, this synthesis followed the GAP chemistry (group-assisted-purification chemistry) process, which can avoid traditional chromatography and recrystallization purifications. Pure products can be obtained by washing the solid of crude products with cold ethanol. The structures of the synthesized compounds are confirmed by $^1$H NMR, $^{13}$C NMR, IR and ESI-MS.

**Results and Discussion**

In initial experiments to optimize the reaction conditions, we used 4-methoxybenzaldehyde (1i), NMSM (2), and 4-hydroxy-6-methyl-2-pyrone (3) in ethanol at 80 °C under microwave
irradiation, using different bases. The bases had a significant influence on the reaction results. When the reaction was conducted using different catalysts the reaction yields were widely variable. As shown in Table 1, the reaction in the absence of catalyst furnished a very low yield of 4i (Table 1, entry 1). And the reaction did not proceed in the presence of strong base (Table 1, entry 2). Besides we noticed that the other bases failed to catalyze the reaction efficiently (Table 1, entries 3-7). It was however gratifying to discover that ammonium acetate catalyzes the reaction in ethanol efficiently, affording a maximum yield (70%) of 4i (Table 1, entry 8).

In the reaction, the microwave energy is another factor which affects the yield of 4i. Figure 3 indicates the relation between the yield of product 4i and the microwave irradiation power. The reaction was carried out under five different power settings: 100W, 200W, 300W, 400W, 500W. We find that the yield of 4i reached 61% when the microwave irradiation power was 100W, increasing to 70% when the microwave irradiation power was increased to 200W. However, if the power was higher than 200W the yield of product 4i fell. This result suggested that higher microwave energy could result in a number of by-products. Moreover, the target product was probably decomposed by the higher energy. Therefore, according to the above analysis, the most suitable power for this reaction is 200 W.

In order to check the effect of the solvent on the reaction, various solvents were evaluated (Table 2). From an economical and environmental point of view, water was first screened as the reaction medium. But due to solubility problem, the yield of the reaction was very low (Table 2, entry 1). Next, organic solvents were screened as the reaction medium (Table 2, entries 2-5). It was found that the yield of compound 4i was much higher with ethyl alcohol as the solvent. Ethanol is relatively cheap, and environmentally friendly compared with other organic solvents.

**Figure 3.** The effect of microwave irradiation power on compound 4i production.
Figure 4. Change of yield of compound 4i over different microwave irradiation times.

When microwave irradiation is employed, the irradiation time is another important parameter in reaction optimization. Figure 4 indicates the interaction between the yield of product 4i and the microwave irradiation time. We tested the effects of five different reaction times on the yield. As shown in the Figure 4, the yield of 4i was speedily improved as the microwave irradiation time increased in the range from 1 min to 5 min, because microwave irradiation can cause molecules of the reactants to vibrate and so bring the reaction temperature to its optimal value in a short time. But when the irradiation time exceeded 5 min the yield of compound 4i decreased, either because by-products were formed or the product 4i was decomposed. So, the ideal microwave irradiation time under our conditions was 5 min.

With this result in hand, we went on to widen the scope of the methodology. Using the optimized reaction conditions, 4-hydroxy coumarin (5) was examined as a replacement for the 2-pyrone. The reactions proceeded well and gave good yields (Table 3, entries 15-18). The results exhibit the scope and generality of the new three component cyclization with respect to a wide range of enol ketones and aldehyde substrates. As shown in Table 3, the yields of the reaction were much higher and the reaction times were much less when compared with conventional heating. These results further indicated that the microwave irradiation synthesis is a very effective method of building heterocyclic structures. The structures of all new compounds 4a~4n and 6a~6d were fully confirmed by means of IR, $^1$H NMR, $^{13}$C NMR and HRMS measurements.
In order to know how the microwave irradiation promotes the reaction, taking into consideration the entire outcome, a possible reaction mechanism for the domino coupling is depicted in Scheme 2.

Scheme 2. Possible reaction mechanism for the compounds 4.

The first step is the Knoevenagel condensation between compound 3 and aldehyde 1 that leads to the adduct 7, which acts as a Michael acceptor. The adduct 7 immediately undergoes Michael-type addition with NMSM 2 to generate the open-chain intermediate 8. The intermediate 8 undergoes intramolecular O-cyclization to give compound 4 with elimination of MeSH.

<sup>a</sup> Conventional heating. <sup>b</sup> Isolated yield.
Conclusions

In summary, we have developed a three-component domino reaction [aldehydes, 4-hydroxy-6-methyl-2-pyrone and \( N\)-methyl-1-(methylthio)-2-nitroethenamine] for regioselective synthesis pyrano[4,3-\(b\)]pyran-5-one derivatives. The products \( 4 \) were obtained in good yields by selective \([1+3+2]\) cycloaddition in this work. The mild conditions, the maximum efficiency of a process and short reaction periods as well as operational simplicity are clearly represented in this one-pot transformation that provides an elegant methodology for the synthesis of highly functionalized pyrano[4,3-\(b\)]pyran-5-one derivatives. The present protocol is also extendable to a wide variety of substrates.

Experimental Section

**General.** \(^1\)H and \(^{13}\)C NMR spectra were recorded at 400 and 100 MHz respectively on a Bruker AC-400 Avance spectrometer with DMSO-\(d_6\) as solvent and TMS as internal standard; J values were given in Hertz (Hz). IR spectra were recorded on a Thermo iS5 FT instrument (KBr pellet). High resolution mass spectra were operated on Aglient 6550 iFunnel Q-TOF. A single-mode Microwave reactor (MAS-II) was used for microwave-mediated reactions. Melting points were measured on X-4 digital display melting point meter. All of the reagents were purchased from chemical reagent Crop. in China and used without further purification.

**General synthetic procedure (conventional heating), exemplified by 7-methyl-2-methylamino-3-nitro-4-aryl-4H-pyrano[4,3-\(b\)]pyran-5-one (4i).** Aromatic aldehyde 1\(i\) (0.5 mmol, 0.054 g, 1.0 equiv), 4-hydroxy-6-methyl-2-pyrone 3 (0.5 mmol, 0.063 g, 1.0 equiv), NMSM 2 (0.5 mmol, 0.074 g, 1.0 equiv), and ammonium acetate (0.5 mmol, 0.039 g, 1.0 equiv) as catalyst were added in a 25 mL three-necked flask. Then ethyl alcohol (2 mL) was added as the solvent. The resulting mixture was refluxed at 80 \(^\circ\)C for 3 h. During this time, a precipitate formed. After completion of the reaction (confirmed by TLC), the reaction mixture was cooled to room temperature. Then the precipitate was removed by filtration and washed with a little cold ethanol to give the pure product.

**General procedure (microwave heating), exemplified by 7-methyl-2-methylamino-3-nitro-4-aryl-4H-pyrano[4,3-\(b\)]pyran-5-one (4i).** Aromatic aldehyde 1\(i\) (0.5 mmol, 0.054 g, 1.0 equiv), 4-hydroxy-6-methyl-2-pyrone 3 (0.5 mmol, 0.063 g, 1.0 equiv), NMSM 2 (0.5 mmol, 0.074 g, 1.0 equiv) and ammonium acetate (0.5 mmol, 0.039 g, 1.0 equiv) were mixed in ethyl alcohol (2 mL). The resulting mixture was heated at 80 \(^\circ\)C under microwave irradiation (200 W) for 5 min. After completion of the reaction (confirmed by TLC), the reaction mixture was cooled to room temperature. The solid was collected and washed with a little cold ethanol to give the pure product.

DMSO-\textit{d}_6 : \delta_H 2.13 (3H, s, O-C-CH_3), 3.03 (3H, d, J_HH 5.2 Hz, NH-CH_3), 4.80 (1H, s, C-CH-C), 6.45 (1H, s, C=CH-C), 6.95-6.99 (2H, m, Ph), 7.18-7.22 (2H, m, Ph). 10.24 (1H, d, J_HH 5.2 Hz, NH). \textit{^{13}C} NMR (100 MHz, DMSO-\textit{d}_6): \delta_C 19.3 (O-C-CH_3), 28.4 (NH-CH_3), 36.1 (C-CH-C), 97.8 (C-NO_2), 103.0 (C=C-O), 107.6 (C=C-C), 114.6, 130.1 (2C), 137.7 (2C) and 156.7 (6C, benzene), 159.8 (C=C-NH), 161.0 (CH_3-C-O), 162.2 (C=O), 163.2 (C=C-O); HRMS (ESI) m/z: calc. for: C_{15}H_{15}N_2O_5FNa, 355.0701 [M+Na]^+; found: 355.0708.

4-(3-Fluorophenyl)-7-methyl-2-(methylamino)-3-nitro-4H-pyran-5-one(4f).
White powder; Yield: 72%; mp 226-228°C; IR (KBr, \nu, cm\textsuperscript{-1}): 3197, 3088, 1725, 1675, 1634, 1603, 1448, 1389, 1351, 1263, 1189, 1136, 1061, 808, 789, 689 cm\textsuperscript{-1}; \textit{^1}H NMR (400 MHz, DMSO-\textit{d}_6): \delta_H 2.24 (3H, s, O-C-CH_3), 3.14 (3H, d, J_HH 4.4 Hz, NH-CH_3), 4.93 (1H, s, C-CH-C), 6.56 (1H, s, C=CH-C), 7.01-7.13 (3H, m, Ph), 7.28-7.33 (1H, m, Ph), 10.37 (1H, d, J_HH 4.4 Hz, NH). \textit{^{13}C} NMR (100 MHz, DMSO-\textit{d}_6): \delta_C 19.3 (O-C-CH_3), 28.5 (NH-CH_3), 36.7 (C-CH-C), 97.8 (C-NO_2), 102.6 (C=C-O), 107.3 (C=C-C), 113.7, 115.2, 124.3, 129.8, 144.3, 156.8 (6C, benzene), 160.6 (C=C-NH), 161.0 (CH_3-C-O), 163.0 (C=O), 163.3 (C=C-O); HRMS (ESI) m/z: calc. for: C_{15}H_{13}N_2O_5FNa, 355.0701 [M+Na]^+; found: 355.0706.

4-(3,4-Difluorophenyl)-7-methyl-2-(methylamino)-3-nitro-4H-pyran-5-one (4g).
White powder; Yield: 76%; mp 192-194°C; IR (KBr, \nu, cm\textsuperscript{-1}): 3223, 3087, 1727, 1671, 1640, 1599, 1514, 1434, 1383, 1363, 1267, 1145, 1072, 829, 768, 668 cm\textsuperscript{-1}; \textit{^1}H NMR (400 MHz, DMSO-\textit{d}_6): \delta_H 2.24 (3H, s, O-C-CH_3), 3.14 (3H, d, J_HH 4.8 Hz, NH-CH_3), 4.91 (1H, s, C-CH-C), 6.56 (1H, s, C=CH-C), 7.14-7.16 (1H, m, Ph), 7.28-7.38 (2H, m, Ph), 10.37 (1H, d, J_HH 4.8 Hz, NH). \textit{^{13}C} NMR (100 MHz, DMSO-\textit{d}_6): \delta_C 19.3 (O-C-CH_3), 28.4 (NH-CH_3), 36.4 (C-CH-C), 97.8 (C-NO_2), 102.3 (C=C-O), 107.2 (C=C-C), 116.7, 117.3, 125.1, 139.2, 147.4 and, 149.9 (6C, benzene), 156.7 (C=C-NH), 156.9 (CH_3-C-O), 161.0 (C=O), 163.4 (C=C-O); HRMS (ESI) m/z: calc. for: C_{14}H_{12}F_2N_2O_5Na, 373.0606 [M+Na]^+; found: 373.0611.

4-(2-Fluorophenyl)-7-methyl-2-(methylamino)-3-nitro-4H-pyran-5-one (4h).
Yellow powder; Yield: 70%; mp 232-234°C; IR (KBr, \nu, cm\textsuperscript{-1}): 3210, 3066, 1728, 1677, 1640, 1592, 1391, 1361, 1265, 1190, 1143, 1067, 840, 782, 747 cm\textsuperscript{-1}; \textit{^1}H NMR (400 MHz, DMSO-\textit{d}_6): \delta_H 2.24 (3H, s, O-C-CH_3), 3.14 (3H, d, J_HH 4.8 Hz, NH-CH_3), 5.08 (1H, s, C-CH-C), 6.56 (1H, s, C=CH-C), 7.05-7.13 (2H, m, Ph), 7.22-7.27 (1H, m, Ph), 7.33-7.37 (1H, m, Ph), 10.38 (1H, d, J_HH 4.8 Hz, NH). \textit{^{13}C} NMR (100 MHz, DMSO-\textit{d}_6): \delta_C 19.3 (O-C-CH_3), 28.6 (NH-CH_3), 32.2 (C-CH-C), 97.7 (C-NO_2), 101.6 (C=C-O), 106.8 (C=C-C), 115.2, 123.8, 127.6, 128.9, 131.7 and 156.9 (6C, benzene), 159.4 (C=C-NH), 160.9 (CH_3-C-O), 161.9 (C=O), 163.3 (C=C-O); HRMS (ESI) m/z: calc. for: C_{14}H_{12}F_2N_2O_5Na, 373.0606 [M+Na]^+; found: 373.0711.

4-(4-Methoxyphenyl)-7-methyl-2-(methylamino)-3-nitro-4H-pyran-5-one (4i).
White powder; Yield: 70%; mp 238-240°C; IR (KBr, \nu, cm\textsuperscript{-1}): 3219, 3081, 1728, 1670, 1640, 1600, 1508, 1379, 1357, 1251, 1171, 1143, 1067, 831, 772, 708 cm\textsuperscript{-1}; \textit{^1}H NMR (400 MHz, DMSO-\textit{d}_6): \delta_H 2.23 (3H, s, O-C-CH_3), 3.14 (3H, d, J_HH 4.0 Hz, NH-CH_3), 3.70 (3H, s, OCH_3), 4.86 (1H, s, C=CH-C), 6.55 (1H, s, C=CH-C), 6.79-6.83 (2H, m, Ph), 7.14-7.18 (2H, m, Ph), 10.32 (1H, d, J_HH 4.4 Hz, NH). \textit{^{13}C} NMR (100 MHz, DMSO-\textit{d}_6): \delta_C 19.3 (O-C-CH_3), 28.4 (NH-CH_3), 35.8 (C-CH-C), 55.0 (O-CH_3), 97.8 (C-NO_2), 103.5 (C=C-O), 107.9 (C=C-C), 113.4,
129.2 (2C), 133.6 (2C) and 156.4 (6C, benzene), 157.0 (C=C-NH), 158.1 (CH3-C-O), 161.1 (C=O), 162.9 (C=O); HRMS (ESI) m/z: calc. for: C11H16N2O6Na, 367.0901 [M+Na]+; found: 367.0892.

7-Methyl-2-(methylamino)-3-nitro-4-p-tolyl-4H-pyran-4,3-b[pyran-5-one (4j). White powder; Yield; 65%; mp 239-241°; IR (KBr, v, cm⁻¹): 3223, 3083, 1731, 1670, 1640, 1599, 1381, 1360, 1266, 1245, 1144, 1069, 829, 770, 686, 668 cm⁻¹; ¹H NMR (400 MHz, DMSO-d₆): δH 2.23 (6H, s, -O-C-H3), 3.14 (3H, d, JHH 5.2 Hz, NH-CH3), 4.88 (1H, s, C-CH-C), 6.55 (1H, s, C=CH-C), 7.06-7.13 (4H, m, Ph), 10.32 (1H, d, JHH 5.2 Hz, NH); ¹³C NMR (100MHz, DMSO-d₆): δc 19.3 (O-C-CH3), 20.6 (C-CH3), 28.4 (NH-CH3), 36.3 (C-CH-C), 97.8 (C-NO₂), 103.4 (C=O), 107.8 (C=C-C), 128.0, 128.5 (2C), 136.0 (2C), and 138.6 (6C, benzene), 156.4 (C=C-NH), 157.0 (CH3-C-O), 161.0 (C=O), 162.9 (C=O); HRMS (ESI) m/z: calc. for: C11H16N2O6Na, 351.0951 [M+Na]+; found: 351.0943.

4-(2,4-Dichlorophenyl)-7-methyl-2-(methylamino)-3-nitro-4H-pyran-4,3-b[pyran-5-one (4k). White powder; Yield; 73%; mp 253-255°; IR (KBr, v, cm⁻¹): 3199, 3068, 1731, 1675, 1639, 1603, 1471, 1445, 1390, 1361, 1264, 1140, 1067, 832, 731, 694 cm⁻¹; ¹H NMR (400 MHz, DMSO-d₆): δH 2.24 (3H, s, O-C-CH3), 3.14 (3H, d, JHH 5.2 Hz, NH-CH3), 5.21 (1H, s, C-CH-C), 6.55 (1H, s, C=CH-C), 7.32-7.35 (1H, m, Ph), 7.42-7.47 (2H, m, Ph), 10.43 (1H, d, JHH 5.2 Hz, NH); ¹³C NMR (100MHz, DMSO-d₆): δc 9.3 (O-C-CH3), 28.4 (NH-CH3), 35.5 (C=C-C), 97.6 (C-NO₂), 100.9 (C=C-C), 106.5 (C=C-C), 126.7, 128.7, 132.1, 134.0, 134.1 and 136.9 (6C, benzene), 157.0 (C=C-NH), 160.7 (2C, CH3-C-O, C=O), 163.6 (C=O); HRMS (ESI) m/z: calc. for: C16H12N2OClNa, 405.0015 [M+Na]+; found: 405.0027.

7-Methyl-2-(methylamino)-4-naphthalen-1-yl-3-nitro-4H-pyran-4,3-b[pyran-5-one (4l). White powder; Yield; 70%; mp 259-261°; IR (KBr, v, cm⁻¹): 3192, 3062, 1731, 1672, 1640, 1600, 1441, 1387, 1363, 1261, 1188, 1135, 1063, 799, 784, 694 cm⁻¹; ¹H NMR (400 MHz, DMSO-d₆): δH 2.22 (3H, s, O-C-CH3), 3.19 (3H, d, JHH 4.8 Hz, NH-CH3), 5.85 (1H, s, C=CH-C), 6.59 (1H, s, C=C=CH-C), 7.27-7.89 (6H, m, Ph), 8.63 (1H, d, JHH 8.8 Hz, Ph), 10.36 (1H, d, JHH 4.8 Hz, NH); ¹³C NMR (100MHz, DMSO-d₆): δc 9.3 (O-C-CH3), 28.5 (NH-CH3), 31.5 (C=CH-C), 97.8 (C-NO₂), 104.4 (C=C-O), 109.2 (C=C-C), 124.8, 125.3, 125.4, 125.5, 126.0, 127.4, 127.9, 131.8, 132.7 and 140.1 (10C, naphthalene), 156.4 (C=C-NH), 156.9 (CH3-C-O), 161.1 (C=O), 162.7 (C=O); HRMS (ESI) m/z: calc. for: C20H16N2O5Na, 387.0951 [M+Na]+; found: 387.0947.

7-Methyl-2-(methylamino)-3-nitro-4-thiophen-2-yl-4H-pyran-4,3-b[pyran-5-one (4m). White powder; Yield; 76%; mp 224-226°; IR (KBr, v, cm⁻¹): 3197, 3069, 1730, 1674, 1639, 1604, 1439, 1389, 1358, 1257, 1189, 1140, 1066, 835, 725, 693 cm⁻¹; ¹H NMR (400 MHz, DMSO-d₆): δH 2.27 (3H, s, O-C-CH3), 3.13 (3H, d, JHH 4.0 Hz, NH-CH3), 5.32 (1H, s, C=CH-C), 6.57 (1H, s, C=CH-C), 6.89-6.91 (2H, m, Ph), 7.31-7.32 (1H, m, Ph), 10.29 (1H, d, JHH 4.0 Hz, NH); ¹³C NMR (100MHz, DMSO-d₆): δc 19.4 (O-C-CH3), 28.4 (NH-CH3), 31.4 (C=C-C), 97.9 (C-NO₂), 102.8 (C=C-O), 107.5 (C=C-C), 124.5, 125.1, 126.6 and 144.8 (4C, thiophene), 156.9 (C=C-NH), 157.0 (CH3-C-O), 161.1 (C=O), 163.4 (C=O); HRMS (ESI) m/z: calc. for: C14H12N2O5SNa, 343.0359 [M+Na]+; found: 343.0350.
4-Furan-2-yl-7-methyl-2-(methylamino)-3-nitro-4H-pyrano[4,3-b]pyran-5-one (4n). Yellow powder; Yield; 76% mp 234-236°C; IR (KBr, ν cm⁻¹): 3074, 1675, 1641, 1605, 1472, 1447, 1363, 1257, 1188, 1139, 1072, 1013, 890, 793, 771 cm⁻¹; ¹H NMR (400 MHz, DMSO-d₆): δ_H 2.26 (3H, s, O-C-CH₃), 3.12 (3H, d, JHH 4.8 Hz, NH-CH₃), 5.16 (1H, s, C-CH-C), 6.26-6.35 (2H, m, Ph), 6.59 (1H, s, C=CH-C), 7.46 (1H, s, Ph), 10.30 (1H, d, JHH 4.8 Hz, NH); ¹³C NMR (100MHz, DMSO-d₆): δ_C 19.4 (O-CH₃), 28.4 (NH-CH₃), 30.4 (C-CH-C), 97.8 (C-NO₂), 100.6 (C=O-C), 125.1 (C-C-C), 130.4 (C-O), 157.1 (C=O), 157.5 (CH₃-C-O), 160.9 (C=O), 163.4 (C=O); HRMS (ESI) m/z: calc. for: C₁₄H₁₂N₂O₃Na, 327.0588 [M+Na]+; found: 327.0586.

4-(2-Methoxyphenyl)-2-(methylamino)-3-nitro-4H-pyrano[3,2-c]chromen-5-one (6a). Light yellow powder; Yield; 69%; mp 251-253°C; IR (KBr, ν cm⁻¹): 3186, 1730, 1635, 1470, 1459, 1381, 1293, 1168, 1104, 1053, 1023, 777, 757, 695 cm⁻¹; ¹H NMR (400 MHz, DMSO-d₆): δ_H 3.35 (3H, d, JHH 5.2 Hz, NH-CH₃), 3.61 (3H, s, OCH₃), 5.08 (1H, s, C-CH-C), 6.89-6.92 (2H, m, Ph), 6.93-7.23 (1H, m, Ph), 7.39-7.55 (3H, m, Ph), 7.72-7.76 (1H, m, Ph), 8.04-8.06 (1H, m, Ph), 10.46 (1H, d, JHH 5.2 Hz, NH); ¹³C NMR (100MHz, DMSO-d₆): δ_C 28.5 (NH-CH₃), 35.9 (C-CH-C), 55.4 (O-CH₃), 104.5 (C-NO₂), 106.5 (C=C-C), 111.8, 112.6, 116.6, 119.8, 122.5, 125.0, 126.8, 128.6, 132.9 (2C), 151.9 and 152.2 (12C, benzene), 157.6 (C=C=NH), 157.7 (C=C-O), 159.2 (C=O); HRMS (ESI) m/z: calc. for: C₂₀H₁₆N₂O₄Na, 403.0926 [M+Na]+; found:403.0922.

4-(4-Dimethylaminophenyl)-2-(methylamino)-3-nitro-4H-pyrano[3,2-c]chromen-5-one (6b). Orange powder; Yield; 74%; mp 259-261°C; IR (KBr, ν cm⁻¹): 3209, 3074, 1736, 1675, 1609,1522, 1456, 1356, 1159, 1106, 1071, 785, 771, 687 cm⁻¹; ¹H NMR (400 MHz, DMSO-d₆): δ_H 2.82 (6H, s, 2CH₃), 3.32 (3H, d, JHH 4.8 Hz, NH-CH₃), 4.97 (1H, s, C-CH-C), 6.60 (2H, d, JHH 8.8 Hz 2H, Ph), 7.11 (2H, d, JHH 8.8 Hz , Ph), 7.48-7.53 (2H, m, Ph), 7.71-7.75 (1H, m, Ph), 7.99-8.01 (1H, m, Ph), 10.36 (1H, d, JHH 5.2 Hz, NH); ¹³C NMR (100MHz, DMSO-d₆): δ_C 28.7 (NH-CH₃), 36.9 (C-CH-C), 43.5 (2C, 2CH₃), 106.3 (C-NO₂), 107.7 (C=C-C), 112.6, 116.6 (2C), 122.8 (2C), 125.0 (2C), 129.7 (2C), 133.2 (2C) and 151.8 (12C, benzene), 152.0 (C=C=NH), 156.7 (C=C-O), 159.2 (C=O); HRMS (ESI) m/z: calc. for: C₂₁H₁₉N₃O₅Na, 416.1325 [M+Na]+; found:416.1219.

2-(Methylamino)-3-nitro-4-thiophen-2-yl-4H-pyrano[3,2-c]chromen-5-one (6c). White powder; Yield; 75%; mp 256-258°C; IR (KBr, ν cm⁻¹): 3050, 1728, 1671, 1627, 1525, 1471, 1356, 1305, 1268, 1163, 1073, 779, 759, 690 cm⁻¹; ¹H NMR (400 MHz, DMSO-d₆): δ_H 3.31 (3H, d, JHH 5.2 Hz, NH-CH₃), 5.48 (1H, s, C-CH-C), 6.90-6.99 (2H, m, Ph), 7.34-7.36 (1H, m, Ph), 7.50-7.55 (2H, m, Ph), 7.75-7.79 (1H, m, Ph), 8.00-8.02 (1H, m, Ph), 10.38 (1H, d, JHH 5.2 Hz, NH); ¹³C NMR (100MHz, DMSO-d₆): δ_C 28.7 (NH-CH₃), 32.0 (C-CH-C), 106.2 (C-NO₂), 107.5 (C=C-C), 112.5, 116.7, 122.8, 124.8, 125.1, 125.4, 126.7, 133.4, 144.2 and 152.0 (10C, benzene and thiophene), 152.3 (C=C=NH), 156.7 (C=C-O), 159.2 (C=O); HRMS (ESI) m/z: calc. for: C₁₃H₁₂N₂O₃SNa, 379.0365 [M+Na]+; found:379.0357.

4-Furan-2-yl-2-(methylamino)-3-nitro-4H-pyrano[3,2-c]chromen-5-one (6d). White powder; Yield; 82%; mp 258-260°C; IR (KBr, ν cm⁻¹): 3137, 1725, 1632, 1472, 1455, 1380, 1304, 1267,
1156, 1106, 1077, 779, 768, 706 cm$^{-1}$; $^{1}$H NMR (400 MHz, DMSO-$d_6$): $\delta_{\text{H}}$ 3.30 (3H, d, $^3J_{\text{HH}}$ 4.0 Hz, NH-CH$_3$), 5.33 (1H, s, C-CH-C), 6.33-6.37 (2H, m, Ph), 7.47-7.53 (3H, m, Ph), 7.74-7.78 (1H, m, Ph), 7.99-8.00 (1H, m, Ph), 10.37 (1H, d, $^3J_{\text{HH}}$ 4.4 Hz, NH); $^{13}$C NMR (100MHz, DMSO-$d_6$): $\delta_{\text{C}}$ 28.7 (NH-CH$_3$), 31.1 (C-CH-C), 104.1 (C-NO$_2$), 105.1 (C=C-C), 107.4, 110.6, 112.5, 116.7, 122.8, 125.1, 133.4, 142.1, 151.8 and 152.0 (10C, benzene and furan), 152.8 (C=C-NH), 157.0 (C=C-O), 159.1 (C=O); HRMS (ESI) $m/z$: calc. for: C$_{17}$H$_{12}$N$_2$O$_5$Na, 363.0607 [M+Na]$^+$; found:363.0605.

**Supplementary Material**

The materials of the structural characterization with of $^1$H NMR, $^{13}$C NMR and IR for this article are available online at the supplementary materials.

**Acknowledgements**

The authors thank the National Natural Science Funds of China (No. 21106069).
