1. **Experimental Section**

**General**

NMR spectra were recorded on a Bruker Avance DPX-500 MHz spectrometer. Chemical shifts are reported relative to TMS as the internal standard. IR spectra were recorded on an Agilent Cary 630 FTIR spectrometer. Mass spectra were recorded under ESI/HRMS using JEOL JMS 600H mass spectrometer. Absorption spectra were recorded on a PerkinElmer UV/Vis Lambda 365 spectrometer. Fluorescence spectra were recorded on a JASCO FP-8300 spectrofluorometer. Time resolved fluorescence experiment was performed by using a IBH picosecond single photon counting system employing a 375 nm nano-LED excitation source. Cerium (IV) Ammonium Nitrate (CAN) was purchased from Merck Specialties Pvt. Ltd and was used as such without further purification. Commercial grade solvents were used. Analytical thin layer chromatography was performed on silica gel coated on aluminium sheets and was monitored using UV light of wavelength 366 nm. Gravity column chromatography was performed using 100-200 mesh silica gel and mixtures of hexane and ethyl acetate were used for elution. Dimethyl 1,3-acetone dicarboxylate, diethyl 1,3-acetone dicarboxylate and 1,5-diphenyl pentane-1,3,5-trione were commercially available and were used as such without further purification.

**General experimental procedure for the synthesis of 3-oxo-1,5-diesters**

Steglich esterification procedure was used for the preparation of 3-oxo-1,5-diesters 1c-1i. To an ice-cold solution of 1,3-acetone dicarboxylic acid in dry dichloromethane (10 ml), excess of alcohol, a pinch of 4,4'-dimethyl amino pyridine (DMAP around 50 mg) and dicyclohexyl carbodiimide (DCC, 3 mmol) were added. The solution was allowed to stir; the reaction was gradually raised to room temperature after 5-10 minutes. Completion of the reaction was indicated by TLC. The reaction mixture was extracted with DCM and washed with sodium bicarbonate. The organic layer was dried over Na$_2$SO$_4$. The residue after removal of the solvent was subjected to column chromatography using silica gel 100-200 mesh and hexane-EtOAc as solvent system.

**Synthesis of 3,6-dihydroxy-benzene -1,2,4,5-tetracarboxylic acid tetraalkyl esters**

General Procedure

To an ice-cold solution of 3-oxo-1,5-diester (100 mg) in dry CH$_3$CN (10ml), 30 mol% CAN was added. The solution was allowed to stir and the temperature was gradually raised to RT. After completion of the reaction as indicated by TLC, the solvent was rotary evaporated and the residue was extracted with dichloromethane and washed with brine (3×10 mL). The organic extract was dried over anhydrous Na$_2$SO$_4$ and the solvent was subsequently removed. The residue was subjected to column chromatography using silica gel 100-200 mesh and hexane-EtOAc solvent system.

**Synthesis of 3,6-Dihydroxy-1,2,4,5-tetrabenzoyl benzene**

To an ice cold solution 100 mg (0.3759 mmol) of 1,5-diphenyl pentane-1,3,5-trione in dry CH$_3$CN solvent (10ml), 30 mol% CAN (61.82 mg, 0.1127 mmol) was added. The solution was allowed to stir and the temperature was gradually raised to RT. After completion of the reaction as indicated by TLC, the solvent was rotary evaporated and the crude residue was
extracted with dichloromethane and washed with brine (3×10 mL). The organic extract was
dried over anhydrous Na$_2$SO$_4$ and the solvent was subsequently removed. The residue was
subjected to column chromatography using silica gel 100-200 mesh and hexane-EtOAc as
solvent system. Elution with 2:8 ethyl acetate: hexane afforded the product 4 as a yellow
powder; yield: 83 mg (42%, recovered yield: 61%, 0.1578 mmol); mp: 201-203 °C.
