#### Abstract

Described herein is electrophilic acetylation and formylation of pyrrolo[1,2-a]pyrazines with substituent(s) at C1 and/or C3 position(s) where substituents around the core skeleton allowed regiodivergent access to C6- or C8-acetylpyrrolo[1,2-a]pyrazines. While acetylation of pyrrolo[1,2-a]pyrazines $(R(1)=H$ and $R(3)=$ aryl or methyl) mainly gave rise to C8-acetylated products, acetylation with pyrrolo[1,2-a]pyrazines ( $R(1)=$ methyl and $\mathrm{R}(2)=$ aryl or methyl) provided C6-acetylated compounds as major products. In contrast, Vilsmeier-Haack formylation of pyrrolo[1,2-a]pyrazines took place at C6 position irrespective of the substituents at C1 and/or C3 site(s).

## Introduction

Generation of novel heterocyclic chemical scaffolds, with unprecedented substitution patterns via regioselective installation of various functional groups around heterocyclic core skeletons, is highly important in the search for new effective pharmacophores in drug discovery programs. As illustrated in Figure 1, the bicyclic aza-heterocyclic pyrrolo[1,2-a]pyrazine system has been employed as a core chemical structure in a variety of medicinal chemistry efforts to discover an array of biological activities, including anticancer and antitubercular activities, depending on the substituents with different orientation. ${ }^{1-6}$

Clearly, these medicinal studies were made possible by synthetic strategies and technologies that enable a variety of functional groups to be arranged around the basic template at will. With the intention to construct a novel pyrrolo[1,2-a]pyrazine-based chemical library, we have reported on a diversity-oriented synthesis of pyrrolo[1,2-a]pyrazines with a (hetero)aryl moiety at the C6 position by way of Pd-catalyzed direct arylation (Scheme 1a). ${ }^{7}$ The resulting 6 -arylpyrrolo[1,2-a]pyrazines were found to have anti-osteoporotic activity. ${ }^{8}$ To explore new territory based on pyrrolo[1,2-a]pyrazine, we investigated electrophilic acylation to install an acyl unit which could be further elaborated. From several literature precedents, ${ }^{9-15}$ we reasoned that Friedel-Crafts type acylation of $\mathbf{1}$ would mainly provide $\mathbf{3}$ having an acyl group at the C6 site (Scheme 1b).

Scheme 1. Synthetic-investigation plans: direct arylation using organometallic chemistry (1a) vs. acylation (1b)

Contrary to our expectation, we found that regioselectivity (C6 vs. C8) of acylation with $\mathbf{1}$ is highly dependent on the substituent(s) of $\mathbf{1}$ and the acylating agent, which is described herein.

## Results and Discussion

As mentioned in the Introduction, we wished to introduce either an acetyl or a formyl group at the C6 position of $\mathbf{1}^{16}$ as a functional handle for further derivatization. For this purpose, we reacted the C3-phenyl compound 1a with acetyl chloride in the presence of $\mathrm{AlCl}_{3}$ as shown in Scheme 2. Two monoacetyl compounds were observed. NMR analysis revealed that the major product is the C8-acetyl pyrrolo[1,2-a]pyrazine (4a') (77\%) and the minor product is the C6-acetylated compound $\mathbf{4 a}(14 \%)$. The structure of $4 \mathbf{a}^{\prime}$ was further confirmed by X-ray crystallographic analysis (Figure 2). ${ }^{17}$

Scheme 2. Electrophilic acylation of 1a

Figure 2. Crystal structure of 4a’

This was quite surprising to us because several previous studies had indicated preferential acetylation at the C6 site of pyrrolo[1,2-a]pyrazines under similar conditions. On the other hand, Vilsmeier-Haack formylation ${ }^{18}$ of 1a produced the C6-formylated product (5a) as the major product. These two results led us to conclude that the steric effect of a phenyl moiety at C3 plays a crucial role in controlling the regioselectivity of acetylation. With our expectation that a bulkier group than acetyl would afford better C 8 regioselectivity, we conducted benzoylation of 1 a with PhCOCl and $\mathrm{AlCl}_{3}$, however, no selectivity was observed in this case. Rather, the C6-benzoylated compound (6a) was obtained slightly preferentially ( $46 \%$ yield) to $\mathbf{6 a}$ ' ( $33 \%$ ). These alterations of reaction sites in Friedel-Crafts type acylations, as well as a lack of systematic study with respect
to substituent effects of pyrrolo[1,2-a]pyrazines on site-selective acylations, led us to investigate the roles of substituents in determining the regioselectivity of acylation.

To examine the general pattern of electrophilic acetylation and formylation, several pyrrolo[1,2-a]pyrazines were submitted to the identical conditions (Scheme 3 and Table 1). As expected, C8-acetylation occurred to afford $4^{\prime}$ as the major products, irrespective of the electronic nature (electron-rich or poor) of the $\mathrm{R}^{2}$ moiety, whereas, products having a formyl group at C6 site were formed under Vilsmeier-Haack formylation conditions (entries 1-6). When $R^{2}$ is methyl, a regioselective ratio of acetylation ( $C 6$ vs $C 8$ ) decreases a little bit probably due to a smaller steric effect (entry 7). In cases of pyrrolo[1,2-a]pyrazines bearing a methyl at $\mathrm{R}^{1}$ site (1f-h), C6-acetylation became a major pathway, indicating that the $R^{1}$ substituent plays a bigger role than $R^{2}$ in regioselection control (entries 9, 11, and 12).

Base-mediated aldol condensation of $\mathbf{4 a} \mathbf{a}^{\mathbf{\prime}} \mathbf{4} \mathbf{4} \mathbf{a}$, and $\mathbf{5 a}$ proceeded well to give the corresponding chalcones ${ }^{19-26} \mathbf{7 - 9}$ in good yields. Notably, easy access to regioisomeric chalcones ( $\mathbf{7 a}, \mathbf{8}$, and 9 ) was allowed by these acetylation/formylation-aldol procedures, enabling us to compare biological effects of these constitutional isomers bearing a chalcone moiety with different orientation. ${ }^{27}$ The formyl group in 5a was also employed to install additional aromatic systems such as pyrrolo[1,2-a]quinoxaline ${ }^{28}$ and benzoxazole ${ }^{29}$ as shown in 10 and 11.

## Conclusions

In summary, we have investigated substituent effect on regioselectivity in electrophilic acetylation and formylation of pyrrolo[1,2-a]pyrazines. While Vilsmeier-Haack formylation proceeded mainly at the C6 position to give the corresponding C6-formyl products, Friedel-Crafts type acetylation occurred at the C6 or C8 positions as a major pathway depending on the pre-existing substituents of the substrates. New substitution patterns of pyrrolo[1,2-a]pyrazines were realized by these regiodivergent acylations. Further functionalization of this basic skeleton and biological tests of the synthesized compounds are currently in progress.

## Experimental Section

General. Unless specified, all reagents and starting materials were purchased from commercial sources and used as received without purification. "Concentrated" refers to the removal of volatile solvents via distillation
using a rotary evaporator. "Dried" refers to pouring onto, or passing through, anhydrous magnesium sulfate followed by filtration. Flash chromatography was performed using silica gel (230-400 mesh) with hexanes, ethyl acetate, and dichloromethane as the eluents. All reactions were monitored by thin-layer chromatography on 0.25 mm silica plates ( $\mathrm{F}-254$ ) visualized with UV light. Melting points were measured using a capillary melting point apparatus. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a 400 MHz NMR spectrometer and were described as chemical shifts, multiplicity ( $s$, singlet; d, doublet; $t$, triplet; q, quartet; m, multiplet), coupling constant in hertz ( Hz ), and number of protons. HRMS was measured with an electrospray ionization (ESI) and Q-TOF mass analyzer.

General procedure A. To a stirred solution of the different pyrrolo[1,2-a]pyrazines ( 30 mg ) were added $\mathrm{AlCl}_{3}$ (10 equiv) and acetyl chloride (10 equiv) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2.5 \mathrm{~mL})$ at room temperature. After being stirred at room temperature for 1-6 h , the reaction mixture was poured into ice-cold water, neutralized with aqueous $\mathrm{NaHCO}_{3}$, and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{~mL} \times 2)$. The organic layers were dried over $\mathrm{MgSO}_{4}$ and concentrated under reduced pressure to give the crude product. Purification by flash chromatography on silica gel (various hexanes:ethyl-acetate ratios) gave the corresponding products.

General procedure B. In a vial charged with DMF ( 1.5 mL ) at $0^{\circ} \mathrm{C}$ was added POCl3 ( 5 equiv) and the reaction mixture was stirred for 20 min . To this mixture was added, dropwise, pyrrolo[1,2-a]pyrazine ( 30 mg , dissolved in 0.5 ml DMF) at $0{ }^{\circ} \mathrm{C}$. After being stirred at room temperature for $1-3 \mathrm{~h}$, the reaction mixture was poured into ice-cold water and neutralized with aqueous NaHCO solution. The reaction mixture was extracted with ethyl acetate ( $5 \mathrm{~mL} \times 2$ ), washed with aqueous $\mathrm{NaCl}(5 \mathrm{~mL} \times 2)$. The organic layers were dried over MgSO 4 and concentrated under reduced pressure to give the crude product. Purification by flash chromatography on silica gel (hexanes:ethyl acetate) afforded the corresponding products.
