Abstract

A mild oxidation of 1,2,3,5,6,11b-hexahydroimidazo[1,2-d][1,4]benzoxazepines using KMnO₄ in DMF at room temperature produces a mixture of unsaturated and partially unsaturated [1,4]benzoxazepines in very good yields. Condensation of 2-(2-bromoethoxy)benzaldehydes with either o-phenylenediamine or ethylenediamine in the presence of oxidative reagents such as sodium metabisulfite in acetonitrile at reflux temperature produces a series of [1,4]benzoxazepines, in a simple way and in good yields. Structures of all the synthesized compounds were established in detail via NMR, HRMS spectra and single-crystal X-ray diffraction analyses.

Keywords: Sodium metabisulfite, potassium permanganate, 2-(2-bromoethoxy)benzaldehydes, ethylenediamine, unsaturated [1,4]benzoxazepines
1,4-Benzoxazepines are of pharmacological interest due to their activity on the central nervous system, as enzyme inhibitors, or as analgesics and antitussives.\textsuperscript{1} The 1,4-oxazepine structure is the parent core of medicinal drugs like amoxapine, loxapine and sintamil.\textsuperscript{2,4} It was reported that 1,4-oxazepine derivatives exhibit biological activity as histone deacetylase inhibitors and as antitumor agents.\textsuperscript{5,6} The privileged 5,6-dihydropyrimidobenzoxazepines and 6,7-dihydrobenzo[f]benzoimidazoloazepines and similar structures are found in numerous medicinally relevant compounds.\textsuperscript{7-10} In recent decades, many compounds with potent activity against P13K\(\alpha\) and NIK have been intensely pursued as potential treatments for various types of cancers and some of these have recently advanced into the clinic (Figure 1).\textsuperscript{7,11-14}

![Figure 1](image_url)

**Figure 1.** Structures of some benzoazepines and similar structures that have potent activity against P13K\(\alpha\) and NIK.

Several approaches have been used to synthesize 5,6-dihydropyrimidobenzoxazepines and 6,7-dihydrobenzo[f]benzoimidazoazepines and their derivatives. Among these approaches are: (i) treatment of benzaldehydes with glyoxal and ammonia followed by bis-alkylation with 1,2-dibromoethane;\textsuperscript{9} (ii) magnesium ethoxide-promoted conversion of nitriles into amidines and its application in 5,6-dihydropyrimidobenzoxazepine synthesis;\textsuperscript{15} (iii) treatment of 2-(2-formylphenoxy)acetic acid with o-phenylenediamine using manganese(II) complex tetrasulfophthalocyanine complex supported on natural silk as catalyst;\textsuperscript{16} (iv) condensation of various ortho-phenylenediamines with 2-(prop-2-yn-1-yloxy)benzaldehydes to produce imidazole derivatives followed by intramolecular cyclization forming 7-methylene-6,7-dihydrobenzo[f]benzo[4,5]imidazo[1,2-\(d\)][1,4]oxazepines;\textsuperscript{17} (v) condensation between 1,2-diketones, 2-formylphenoxy acetic acids, and ammonium acetate in acetic acid under reflux conditions;\textsuperscript{18} (vi) condensation of salicylaldehyde with ortho-phenylenediamine using sodium metabisulfite as a catalyst which forms a benzimidazole phenol followed reaction with 1,2-dibromoethane in the presence of base;\textsuperscript{10} (vii) a one-pot combination of condensation, Mannich, oxidation, and aza-Michael addition reactions, employing a variety of...
functionalized anilines and aldehydes suitably poised with a Michael acceptor. Scandium triflate (Sc(OTf)₃) in acetonitrile was found to promote the construction of benzoxazepines scaffolds.¹⁹

Levan et al. reported the isolation and characterization of the unsubstituted 1,2,3,4,5,6,11-hexahydro imidazo-[1,2-d]benzoxazepine as a by-product in a tedious route and without mentioning the product yield.²⁰,²¹

**Results and Discussion**

Recently, we reported new and a convenient synthetic methods for synthesis of [1,4]benzoxazepines.²²,²³ In continuation of our research program regarding the synthesis of biologically active nitrogen heterocycles, herein we describe development of new and straightforward approaches for preparation of 5,6-dihydroimidazobenzoxazepines 20-26 and 6,7-dihydrobenzo[f]benzimidazoloxazepines 35-39, in good yields (Figure 2).

![Figure 2](image_url)

**Figure 2.** Structures of 5,6-dihydroimidazobenzoxazepines 20-26 and 6,7-dihydrobenzo[f]benzimidazoloxazepines 35-39.

The synthetic pathway for preparation of targeted compounds 20-26, is shown in Scheme 1. It starts from the condensation of 2-(2-bromoethoxy)benzaldehydes 6-12 with ethylene diamine in the presence of anhydrous K₂CO₃ and acetonitrile at reflux temperature to give the corresponding saturated oxazepines 13-19.²²,²³ In addition to its ¹H, ¹³C NMR and mass spectra, the structure of compound 16 was confirmed by X-ray analysis as shown in Figure 3. Oxidation of 13-19 with potassium permanganate in DMF at room temperature produced the targeted unsaturated benzoxazepines 20-26 in addition to the partially unsaturated benzoxazepines 27-33 in very good yields. Several experimental trials were carried out such as increasing the equivalents of KMnO₄ and/or increasing the reaction temperature to 65 °C in attempts to produce only unsaturated oxazepines 20-26, failed. The unsaturated oxazepine 40 (where X = Y = H) was not detected in the crude products.
Figure 3. Crystal structure of oxazepine 16. Thermal ellipsoids are shown at 30% probability.

Scheme 1. Preparation of compounds 20-26 and 27-33.

The compounds 20-26 and 27-33 were characterized by $^1$H, $^{13}$C NMR and high resolution mass spectroscopy. The mass spectra of prepared compounds displayed the correct molecular ion peaks for which the measured high resolution (HRMS) data were in good agreement with the calculated values. Spectral data, detailed in the experimental part, are consistent with the suggested structures. The structures of compounds 27-33 were confirmed by disappearance of CHNN and the secondary amine proton signals that usually show up as a sharp singlet and broad signals at around $\delta = 5$ and 2.4 ppm, respectively, in their corresponding saturated oxazepines 13-19. Additionally, structure of compound 29 was confirmed by X-ray analysis as shown in Figure 4.
In a similar manner, several experimental trials were carried out to condense 2-(2-bromoethoxy)benzaldehyde 6 with ortho-phenylenediamine as an example, failed and only a complex inseparable mixture of products was formed. Usually, one of the methods that is used in preparation of 2-arylbenzimidazoles is the condensation of ortho-phenylenediamines with aldehydes in the presence of oxidative reagents such as sodium metabisulfite. Accordingly, when K$_2$CO$_3$ was replaced with sodium metabisulfite, compound 35 was formed straightforwardly and as a unique product in a one-pot process. We believe that the condensation of phenylenediamine with aldehyde 6 under oxidative condition generates first the benzimidazole core followed by intramolecular nucleophilic substitution between nitrogen of the benzimidazole ring and 2-(2-bromoethoxy) unit. Using this strategy, a series of 6,7-dihydrobenzo[f]-4,5-imidazo[1,2-d][1,4]oxazepines 35-39 were prepared in easily and in good yields (Scheme 2). $^1$H NMR spectra of compounds 35-39 in CDCl$_3$ show two multiplets at about 4.5 and 4.6 ppm corresponding to the two methylene protons of the benzoxazepine ring. Their $^{13}$C NMR spectra in CDCl$_3$, displayed two signals at about 47 and 69 ppm which also corresponding to the carbon atoms of the oxazepine ring. Additionally, the structure of compound 36 was confirmed by X-ray analysis as shown in Figure 5. Inspired by these results, we turned our attention again to the condensation of aldehydes 6 and 8, as examples, with ethylenediamine in the presence of sodium metabisulfite. Indeed, when aldehydes 6 or 8 were condensed with ethylenediamine in the presence of sodium metabisulfite in acetonitrile at reflux temperature, products whose physical and spectroscopic properties (mp, NMR and HRMS) were identical to those of 27 and 29, in yields of 52% and 49% respectively, were obtained.

![Figure 4](image-url)  
Figure 4. Crystal structure of oxazepine 29. Thermal ellipsoids are shown at 30% probability.

The seven-membered ring is nonplanar in the three compounds (16, 29 and 36). The mean deviations of the atoms (N1, C2, C6, C7, O8, C9 and C10) from the average plane are 0.2654 Å, 0.1470 Å, 0.1757Å, for 16, 29 and 36, respectively. The degree of non-planarity is the highest in 16 and due to that, the five-membered ring is nonplanar, whereas it is planar in 29 and 36. The average deviation of the atoms N1, C2, N3, C4 and C5 are 0.1584 Å, 0.0029 Å and 0.0386 Å for 16, 29 and 36, respectively. This is due to the fact that C2 is sp$^2$ hybridized in 29 and 36 while it is sp$^3$ hybridized in 16. The C2-N3 is single bond in 16 (bond distance = 1.456(3) Å) and double bond in 29 and 36 (bond distance = 1.281(5) Å).
Scheme 2. Preparation of compounds 35-39.

Figure 5. Crystal structure of oxazepine 36. Thermal ellipsoids are shown at 30% probability.

The supramolecular structure of the three compounds (16, 29 and 36) is developed based on N-H...N hydrogen bonding interactions and C-Br...N halogen bonding interactions in addition to other weaker interactions based on C-H groups. The interactions based on C-H groups are not analyzed due to the abundance of these groups. The crystal structure of 16 is developed based on N-H...N hydrogen bonding interactions. Hydrogen bond parameters are 2.266 Å, 3.153 Å and 168.9° for H...N, N...N and N-H...N, respectively. Hydrogen bonding interactions link the molecular units to chain structures running parallel to crystallographic C-axis (Figure 6A). Due to the absence of strong proton donor (N-H group) in 29 and 36 and the presence of a halogen donor (C-Br group), halogen bonding interactions connect the molecular units to form a dimer structure as shown in Figures 6B and 6C. The Br...N distances are 3.374 Å and 3.392 Å for 29 and 36, which are around the sum of van der Waals radii (3.4 Å). Also, the C-H...N angles are 158.0° and 158.2° which are in suitable arrangement for halogen bonding interactions.25
Figure 6. Illustration of hydrogen bonding interaction in 16 (A), halogen bonding interactions in 29 (B) and 36 (C).

Conclusions

Oxidation of 1,2,3,5,6,11b-hexahydroimidazo[1,2-d][1,4]benzoxazepines with potassium permanganate in DMF at room temperature produced a mixture of unsaturated and partially unsaturated oxazepines in very good yields. Condensation of 2-(2-bromoethoxy)benzaldehydes with o-phenylenediamine in the presence of oxidative reagents such as sodium metabisulfite in acetonitrile at reflux temperature produced a series of 6,7-dihydrobenzo[f]-4,5-imidazo[1,2-d][1,4]oxazepines, in a one-pot process. The advantages of these methods are high yields, readily available starting materials, simple procedures and straightforward purification of the products.

Experimental Section

General. Silica gel 60 for column chromatography was obtained from Fluka. The progress of reactions was monitored by means of thin-layer chromatography (TLC), carried out on TLC sheets that were visualized under UV light (where appropriate). On the other hand, preparative thick layer (0.25 mm) chromatography was performed on silica gel glass plates (60 F-254, 20 cm × 20 cm, Fluka). Melting points were determined on a Stuart scientific melting point apparatus in open capillary tubes and are uncorrected. $^1$H NMR and $^{13}$C NMR spectra were recorded on a 500 MHz spectrometer (Bruker DPX-500) with TMS as the internal standard. Chemical shifts expressed in (δ) are given in ppm, whereas J-values for $^1$H–$^1$H coupling constants are given in Hertz. High-resolution mass spectra (HRMS) were obtained (in positive/or negative ion mode) using electron spray ion trap (ESI) technique with a Bruker APEX-4 (7 Tesla) instrument. Samples were dissolved in
acetonitrile, diluted in spray solution (methanol/water 1:1 v/v + 0.1% formic acid), and infused using a syringe pump with a flow rate of 2 µL/min. External calibration was conducted using arginine cluster in a mass range m/z 175-871. 2-(2-Bromoethoxy)benzaldehydes 6-12 and benzoxazepines 13, 18, 19 were prepared according to the literature.22,23 Benzoazepines 14-17 were prepared as 13, 18 and 19.22 Their physical properties and spectroscopic analyses were as follows:

10-Chloro-1,2,3,5,6,11b-hexahydroimidazo[1,2-d][1,4]benzoxazepine (14). The crude product was purified by washing with EtOAc to give a colorless solid; yield 88%; mp 65-66 °C; 1H NMR (CDCl3) δ 2.35 (br, 1H), 2.58 (m, 1H), 2.90 (m, 1H), 3.16 (m, 2H), 3.27 (m, 1H), 3.78 (m, 1H), 4.29 (m, 1H), 4.46 (s, 1H), 6.88 (d, J 8.5 Hz, 1H), 7.05 (d, J 8.2 Hz, 1H), 7.56 (s, 1H); 13C NMR (CDCl3) δ 44.1, 55.8, 56.4, 72.4, 78.2, 122.4, 126.5, 128.4, 128.9, 136.1, 157.1; HRMS (ESI) m/z: calculated for C15H13ClN2O [M + H]+ 225.0795, found 225.0789.

10-Bromo-1,2,3,5,6,11b-hexahydroimidazo[1,2-d][1,4]benzoxazepine (15). The crude product was purified by washing with EtOAc to give pale yellow solid, yield 78%; mp 88-90 °C; 1H NMR (CDCl3) δ 2.26 (br, 1H), 2.63 (m, 1H), 2.96 (m, 1H), 3.21 (m, 3H), 3.32 (br, 1H), 3.84 (m, 1H), 4.34 (m, 1H), 4.53, (s, 1H), 6.88 (d, J 8.5 Hz, 1H), 7.30 (d, J 8.2 Hz, 1H), 7.77 (s, 1H); 13C NMR (CDCl3) δ 44.1, 55.8, 56.3, 72.4, 78.2, 116.6, 122.9, 129.5, 131.4, 136.7, 157.6; HRMS (ESI) m/z: calculated for C15H13BrN2O [M + H]+ 269.0289, found 269.0284.

10-Methyl-1,2,3,5,6,11b-hexahydroimidazo[1,2-d][1,4]benzoxazepine (16). The crude product was purified by washing with MeCN to give pale yellow solid, yield 93%; mp 90-91 °C; 1H NMR (CDCl3) δ 2.30 (s, 3H), 2.41 (s, 1H), 2.61 (br, 1H), 2.94 (br, 1H), 3.21-3.34 (m, 4H), 3.82 (br, 1H), 4.29 (br, 1H), 4.47, (s, 1H), 6.90 (d, J 8.0 Hz, 1H), 6.99 (d, J 7.8 Hz, 1H), 7.30 (s, 1H); 13C NMR (CDCl3) δ 20.9, 21.0, 21.0, 22.9, 23.0, 23.0, 23.0, 23.0, 23.0; HRMS (ESI) m/z: calculated for C15H16BrN2O [M + H]+ 265.1341, found 265.1335.

10-Methoxy-1,2,3,5,6,11b-hexahydroimidazo[1,2-d][1,4]benzoxazepine (17). The crude product was purified by washing with EtOAc to give pale yellow solid, yield 91%; mp 81-82 °C; 1H NMR (CDCl3) δ 2.13 (br, 1H), 2.60 (br, 1H), 2.92 (br, 1H), 3.18 (m, 3H), 3.30 (m, 1H), 3.75 (m+s, 4H), 4.25 (m, 1H), 4.48, (s, 1H), 6.67 (dd, J 2.7 and 8.7 Hz, 1H), 6.90 (d, J 8.7 Hz, 1H), 7.11 (d, J 2.7 Hz, 1H); 13C NMR (CDCl3) δ 44.1, 55.7, 56.2, 56.4, 72.4, 78.6, 111.3, 113.6, 121.8, 135.1, 152.4, 155.8; HRMS (ESI) m/z: calculated for C15H16N2O2 [M + H]+ 221.1290, found 221.1285.

General Procedure for the Preparation of [1,4]Benzoxazepines (20-26) and (27-33). In a 20 mL one-necked round-bottom flask equipped with a magnetic stirrer bar, saturated benzoazepine 13-19 (1 mmol) was dissolved in DMF (5 mL). To this well-stirred solution at rt, KMnO4 (2 mmol) was added gradually. The reaction mixture was left stirring at rt for 24h. The reaction mixture was diluted with CHCl3 (20 ml) and filtered. The filtrate was washed with 10 mL of saturated aq NaCl and then with 10 mL of H2O. After drying and evaporating the solvent, the crude product was purified as indicated for individual reaction.

5,6-Dihydroimidazo[1,2-d][1,4]benzoxazepine (20) and 2,3,5,6-tetrahydroimidazo[1,2-d][1,4]benzoxazepine (27). The crude product was purified by preparative TLC using CHCl3:CH3OH (9:1) + few drops of TEA to give:

Compound (20). Light-brown solid (0.091 g, 48%), mp 100-101°C (lit mp 102-104 °C)15; 1H NMR (CDCl3) δ 4.34 (m, 2H), 4.41 (m, 2H), 6.95 (s, 1H), 7.97 (d, J 8.1 Hz, 1H), 7.08 (t, J 7.3 Hz, 1H), 7.14 (s, 1H), 7.21 (t, J 7.2 Hz, 1H), 8.48 (d, J 8.0 Hz, 1H); 13C NMR (CDCl3) δ 49.9, 68.4, 118.7, 120.4, 121.7, 122.9, 129.0, 129.8, 130.1, 144.4, 155.4; HRMS (ESI) m/z: calculated for C15H12N2O [M + H]+ 187.0871, found 187.0866.

Compound (27). Light-brown solid (0.049 g, 26%); mp 65-66.5 °C; 1H NMR (CDCl3) δ 3.92 (m, 2H), 4.10 (m, 2H), 4.33, (m, 2H), 4.52 (m, 2H), 7.03(d, J 7.9 Hz, 1H), 7.17 (t, J 9 Hz, 1H), 7.50 (t, J 9 Hz, 1H), 8.40 (d, J 8.1 Hz, 1H); 13C NMR (DMSO-d6) δ 44.4, 47.1, 49.7, 65.3, 114.2, 116.2, 117.9, 127.4, 127.7, 152.5, 159.2; HRMS (ESI) m/z: calculated for C15H13N2O [M + H]+ 189.1028, found 189.1022.
10-Chloro-5,6-dihydroimidazo[1,2-d][1,4]benzoazepine (21) and 10-chloro-2,3,5,6-tetrahydroimidazo[1,2-d][1,4]benzoazepine (28). The crude product was purified by preparative TLC using EtOAc:CH3OH (8:2) + few drops of TEA to give:

**Compound (21).** Light-brown solid (0.097 g, 44%); mp 131-133 °C (lit. mp 128-130 °C); 1H NMR (CDCl3) δ 4.48 (m, 2H), 6.97 (br, 1H), 7.06 (s, 1H), 7.23 (br, 1H), 7.32 (s, 1H), 8.55 (s, 1H); 13C NMR (CDCl3) δ 50.9, 69.7, 121.0, 122.6, 122.8, 129.4, 129.5, 129.7, 129.9, 143.9, 154.7; HRMS (ESI) m/z: calculated for C11H10ClN2O [M + H]+ 221.0482, found 221.0476.

**Compound (28).** Light-brown solid (0.071 g, 32%); mp 61-62 °C; 1H NMR (CDCl3) δ 3.43 (br, 2H), 3.57 (m, 2H), 3.85 (m, 2H), 4.29 (br, 2H), 6.88 (d, J 8.7 Hz, 1H), 7.24 (br, 1H), 8.14 (s, 1H); 13C NMR (CDCl3) δ 49.1, 51.9, 54.6, 70.2, 120.1, 122.4, 127.8, 131.5, 132.2, 155.9, 162.7; HRMS (ESI) m/z: calculated for C11H12ClN2O [M + H]+ 223.0638, found 223.0633.

10-Bromo-5,6-dihydroimidazo[1,2-d][1,4]benzoazepine (22) and 10-bromo-2,3,5,6-tetrahydroimidazo[1,2-d][1,4]benzoazepine (29). The crude product was purified by preparative TLC using CHCl3:CH3OH (9.5:0.5) + few drops of TEA to give:

**Compound (22).** Colorless solid (0.101 g, 39%); mp 118-120 °C (lit. mp 120-122 °C); 1H NMR (CDCl3) δ 4.37 (m, 2H), 4.42 (m, 2H), 6.87 (d, J 8.6 Hz, 1H), 6.97 (br, 1H), 7.16 (s, 1H), 7.28 (m, 1H), 8.65 (d, J 2.1 Hz, 1H); 13C NMR (CDCl3) δ 49.9, 68.4, 115.6, 122.2, 122.3, 128.9, 132.2, 132.6, 143.3, 154.4; HRMS (ESI) m/z: calculated for C11H10BrN2O [M + H]+ 264.9976, found 264.9971.

**Compound (29).** Colorless solid (0.100 g, 39%); mp 71-72 °C; 1H NMR (CDCl3) δ 3.41 (m, 2H), 3.54 (m, 2H), 3.82 (m, 2H), 4.27 (m, 2H), 6.80 (br, 1H), 7.34 (m, 1H), 8.28 (s, 1H); 13C NMR (CDCl3) δ 49.1, 51.9, 54.6, 70.2, 115.0, 120.6, 122.8, 134.5, 135.0, 156.4, 162.5; HRMS (ESI) m/z: calculated for C11H12BrN2O [M + H]+ 267.0133, found 267.0128.

10-Methyl-5,6-dihydroimidazo[1,2-d][1,4]benzoazepine (23) and 10-methyl-2,3,5,6-tetrahydroimidazo[1,2-d][1,4]benzoazepine (30). The crude product was purified by preparative TLC using EtOAc:CH3OH (7:3) + few drops of TEA to give:

**Compound (23).** Beige solid (0.113 g, 56%); mp 88-89 °C (lit. mp 91-93 °C); 1H NMR (CDCl3) δ 2.32 (s, 3H), 4.35-4.41 (m, 4H), 6.88 (d, J 8.3 Hz, 1H), 6.95 (s, 1H), 7.02 (d, J 7.6 Hz, 1H), 7.15 (s, 1H), 8.29 (s, 1H); 13C NMR (CDCl3) δ 20.5, 50.0, 68.4, 120.2, 121.6, 128.9, 129.9, 130.7, 132.4, 153.4; HRMS (ESI) m/z: calculated for C12H13N2O [M + H]+ 201.1028, found 201.1022.

**Compound (30).** Colorless solid (0.065 g, 32%); mp 60-61 °C; 1H NMR (CDCl3) δ 2.31 (s, 3H), 3.80 (br, 2H), 4.10 (m, 2H), 4.20 (m, 2H), 4.45 (br, 2H), 6.86 (d, J 8.4 Hz, 1H), 7.25 (d, J 8.5 Hz, 1H), 8.38 (s, 1H); 13C NMR (CDCl3) δ 20.2, 43.1, 50.2, 53.4, 69.1, 109.8, 121.2, 132.6, 133.7, 132.7, 137.5, 157.5, 162.7; HRMS (ESI) m/z: calculated for C12H12N2O [M + H]+ 203.1184, found 203.1179.

10-Methoxy-5,6-dihydroimidazo[1,2-d][1,4]benzoazepine (24) and 10-methoxy-2,3,5,6-tetrahydroimidazo[1,2-d][1,4]benzoazepine (31). The crude product was purified by preparative TLC using EtOAc:CH3OH (8:2) + few drops of TEA to give:

**Compound (24).** Pale brown solid (0.117 g, 54%); mp 83-84.5 °C (lit. mp 86-88 °C); 1H NMR (CDCl3) δ 3.83 (s, 3H), 4.35-4.38 (m, 4H), 6.78 (m, 1H), 6.90 (d, J 8.8 Hz, 1H), 7.00 (s, 1H), 7.15 (s, 1H), 7.92 (d, J 2.7 Hz, 1H); 13C NMR (CDCl3) δ 50.1, 55.8, 68.5, 111.7, 117.8, 119.4, 121.6, 121.9, 129.1, 144.4, 149.7, 155.1; HRMS (ESI) m/z: calculated for C12H13N2O2 [M + H]+ 217.0977, found 217.0972.

**Compound (31).** Pale yellow solid (0.055 g, 25%); mp 69-70 °C; 1H NMR (CDCl3) δ 3.59 (m, 2H), 3.88 (s+m, 5H), 3.99 (m, 2H), 4.31 (m, 2H), 6.90 (d, J 8.8 Hz, 1H), 6.97 (d, J 8.9 Hz, 1H), 7.72 (s, 1H); 13C NMR (CDCl3) δ 49.5, 53.9, 56.5, 56.7, 69.7, 113.5, 122.5, 122.6, 163.4; HRMS (ESI) m/z: calculated for C12H15N2O2 [M + H]+ 219.1134, found 219.1128.
10-Nitro-5,6-dihydroimidazo[1,2-d][1,4]benzoazepine (25) and 10-nitro-2,3,5,6-tetrahydroimidazo[1,2-d][1,4]benzoazepine (32). The crude product was purified by preparative TLC using CHCl₃:CH₃OH (9.5:0.5) + few drops of TEA to give:

**Compound (25).** Pale yellow solid (0.088 g, 38%); mp > 200°C (decomp.); ¹H NMR (CDCl₃) δ 4.42 (m, 2H), 4.53 (m, 2H), 6.99-7.07 (br, 2H), 7.17 (br, 1H), 8.02 (d, J 8.3 Hz, 1H), 9.40 (s, 1H); ¹³C NMR (CDCl₃) δ 49.5, 68.9, 119.1, 121.6, 122.5, 124.2, 126.5, 129.9, 159.2, 163.8; HRMS (ESI) m/z: calculated for C₁₁H₁₀N₃O [M + H]⁺ 232.0722, found 232.0717.

**Compound (32).** Yellow solid (0.121 g, 52%); mp 148-150°C; ¹H NMR (CDCl₃) δ 3.50-3.57 (br 4H), 3.87 (br, 2H), 4.40 (br, 2H), 7.01 (br, 1H), 8.10 (br, 1H), 9.10 (br, 1H); ¹³C NMR (CDCl₃) δ 48.9, 52.7, 55.0, 70.5, 121.8, 126.6, 129.3, 142.6, 161.6; HRMS (ESI) m/z: calculated for C₁₁H₁₂N₃O [M + H]⁺ 234.0879, found 234.0873.

5,6-Dihydroimidazo[1,2-d]naphtho[2,3-f][1,4]oxazepine (26) and 2,3,5,6-tetrahydroimidazo [1,2-d]naphtho[2,3-f][1,4]oxazepine (33). The crude product was purified by preparative TLC using CHCl₃:CH₃OH (9.5:0.5) + few drops of TEA to give:

**Compound (26).** Pink solid (0.114 g, 48%); mp 155-156°C; ¹H NMR (CDCl₃) δ 4.41 (br, 2H), 4.49 (br, 2H), 7.01 (s, 1H), 7.22 (s, 1H), 7.32-7.42 (m, 3H), 7.66 (d, J 8.1 Hz, 1H), 7.86 (d, J 8.1 Hz, 1H), 9.02 (br, 1H); ¹³C NMR (CDCl₃) δ 50.0, 69.0, 116.2, 120.6, 121.9, 125.0, 126.4, 127.2, 128.6, 129.1, 130.0, 130.2, 134.1, 144.8, 153.4; HRMS (ESI) m/z: calculated for C₁₅H₁₃N₂O [M + H]⁺ 237.1028, found 237.1022.

**Compound (33).** Brown solid (0.091 g, 38%); mp 99-101°C; ¹H NMR (CDCl₃) δ 3.54 (t, J 4.9 Hz, 2H), 3.79 (t, J 9.9 Hz, 2H), 4.00 (t, J 10 Hz, 2H), 4.37 (t, J 4.9 Hz, 2H), 7.22 (s, 1H), 7.38 (t, J 7 Hz, 1H), 7.48 (t, J 7 Hz, 1H), 7.66 (d, J 8.3 Hz, 1H), 7.92 (d, J 8.1 Hz, 1H), 9.00 (s, 1H); ¹³C NMR (CDCl₃) δ 48.8, 53.9, 70.4, 117.4, 125.5, 126.4, 128.7, 129.4, 129.8, 133.9, 153.8, 164.2; HRMS (ESI) m/z: calculated for C₁₅H₁₃N₂O [M + H]⁺ 239.1184, found 239.1179.

**General Procedure for the Preparation of [1,4]Benzoazepines (35-39).** In a 50 mL two-necked round bottom flask equipped with a magnetic stirrer bar, a reflux condenser, 2-(2-bromoethoxy)benzaldehyde (2 mmol) and ortho-phenylenediamine (2 mmol) were dissolved in anhydrous MeCN (25 ml). To this well-stirred solution at rt was added Na₂S₂O₅ (4 mmol) gradually. The reaction mixture was refluxed with stirring for 24-48 h. The reaction mixture was filtered after cooling, and the solvent was evaporated. The crude product was purified by flash chromatography using EtOAc:hexane (3:7).

6,7-Dihydrobenzo[f]-4,5-imidazo[1,2-d][1,4]oxazepine (35). Beige solid (0.320 g, 58%); sample was crystallized from ethanol mp 211-213°C (lit. mp 208-209°C)¹⁰; ¹H NMR (CDCl₃) δ 4.52 (m, 2H), 4.61 (m, 2H), 7.10 (dd, J 1.5 and 8.5 Hz, 1H), 7.19-7.23 (m, 1H), 7.28-7.41 (m, 4H), 7.86 (m, 1H), 8.78 (dd, J 2.0 and 8.0 Hz, 1H); ¹³C NMR (CDCl₃) δ 47.1, 68.9, 109.2, 118.4, 119.6, 120.8, 122.9, 123.0, 123.1, 131.5, 131.7, 136.2, 142.4, 150.1, 157.1; HRMS (ESI) m/z: calculated for C₁₅H₁₃N₂O [M + H]⁺ 237.1028, found 237.1022.

2-Bromo-6,7-dihydrobenzo[f]-4,5-imidazo[1,2-d][1,4]oxazepine (36). Beige solid (0.361 g, 58%); sample was crystallized from methanol mp 217-219°C; ¹H NMR (CDCl₃) δ 4.52 (m, 2H), 4.59 (m, 2H), 6.97 (d, J 11 Hz, 1H), 7.32-7.37 (m, 3H), 7.42 (dd, J 3.0 and 7.5 Hz, 1H), 7.84 (m, 1H), 8.92 (d, J 3.0 Hz, 1H); ¹³C NMR (CDCl₃) δ 47.1, 69.0, 109.2, 115.7, 119.8, 120.2, 122.6, 123.2, 123.3, 133.7, 134.1, 136.3, 142.3, 148.6, 156.1; HRMS (ESI) m/z: calculated for C₁₅H₁₂BrN₂O [M + H]⁺ 315.0133, found 315.0128.

2-Nitro-6,7-dihydrobenzo[f]-4,5-imidazo[1,2-d][1,4]oxazepine (37). Pale brown solid (0.370 g, 66%); sample was washed with methanol and then with ethylacetate mp 224-226°C; ¹H NMR (CDCl₃) δ 4.61 (m, 2H), 4.73 (m, 2H), 7.19 (d, J 11 Hz, 1H), 7.36 (m, 3H), 7.88 (m, 3H), 8.17 (dd, J 3.0 and 11.5 Hz, 1H), 9.71 (d, J 1.5 Hz, 1H); ¹³C NMR (CDCl₃) δ 46.7, 69.4, 109.2, 118.7, 120.2, 121.9, 123.4, 123.7, 125.7, 128.1, 136.3, 142.5, 143.2, 147.7, 160.8; HRMS (ESI) m/z: calculated for C₁₅H₁₂N₃O₃ [M + H]⁺ 282.0879, found 282.0873.
6,7-Dihydrobenzo[4,5]imidazo[1,2-d]naphtho[2,3-f][1,4]oxazepine (38). Pale brown solid (0.270 g, 47%); sample was washed with EtOAc mp 196-198 °C; [1H NMR (CDCl₃) δ 4.57 (m, 2H), 4.69 (m, 2H), 7.29 (s, 1H), 7.35-7.57 (m, 4H), 7.54 (s, 1H), 7.76 (d, J 10.5 Hz, 1H), 7.91-7.93 (m, 1H), 8.00 (d, J 10.5 Hz, 1H), 9.33 (s, 1H); [13C NMR (CDCl₃) δ 47.2, 69.4, 109.4, 116.7, 119.6, 120.5, 123.1, 123.2, 125.3, 126.5, 127.9, 128.9, 130.0, 132.5, 135.0, 136.2, 142.4, 150.0, 154.4; HRMS (ESI) m/z: calculated for C₁₉H₁₅N₂O [M + H]+ 287.1184, found 287.1179

8,9-Dihydrobenzo[4,5]imidazo[1,2-d]naphtho[1,2-f][1,4]oxazepine (39). Yellow solid (0.392 g, 51%); sample was washed with EtOAc mp 129-131 °C; [1H NMR (CDCl₃) δ 4.29 (t, J 7.5 Hz, 2H), 4.61 (t, J 7.5 Hz, 2H), 7.18 (s, 1H), 7.27-7.31 (m, 2H), 7.37 (m, 1H), 7.42 (m, 1H), 7.51 (m, 1H), 7.80 (d, J 10.0 Hz, 1H), 7.88 (s, 1H), 7.90 (m, 1H), 8.86 (s, 1H); [13C NMR (CDCl₃) δ 41.2, 74.4, 108.6, 118.6, 120.3, 121.9, 122.4, 122.9, 125.6, 126.2, 127.9, 128.1, 131.3, 132.2, 132.5, 134.0, 143.4, 150.3, 153.1; HRMS (ESI) m/z: calculated for C₁₉H₁₅N₂O [M + H]+ 287.1184, found 287.1179

Crystal structure determination

The crystal structures of compounds 16, 29 and 36 were determined at rt using an 'Xcalibur, Eos' diffractometer (Mo Kα radiation, λ = 0.7107 Å). Data were acquired and processed to give hkl files using CrysAlisPro software. A preliminary solution of the structures was obtained using the Olex2 program, then, the structure solutions were refined and finalized using the SHELXTL program package. Atoms other than hydrogen were refined anisotropically. Hydrogen atoms were placed in the calculated positions using a riding model. Summary of data collection parameters and refinement results are given in Supplementary Material. The CIF files of compounds 16, 29 and 36 were deposited in Cambridge Crystallographic Data Center. Their CCDC are 1897620, 1897621 and 1897622, respectively.

Acknowledgements

Many thanks to the Chemistry Department at The University of Jordan for running the NMR, HRMS spectra and X-ray structure analysis.

Supplementary Material

Copies of [1H, [13C NMR and of HRMS spectra for compounds 14-17, 20-33 and 35-39 and a table of crystal data for structures 16, 29, 36 can be found in the Supplementary Material.
