#### Abstract

Novel chiral bifunctional thiourea derivatives have been synthesised and successfully applied to the intermolecular Morita-Baylis-Hillman (MBH) reaction of an aromatic aldehyde with methyl vinyl ketone (MVK) and to the intramolecular MBH reaction of $\omega$-formyl-enone. The corresponding products were obtained with high enantioselectivities (up to $98 \%$ ee). The thiourea organocatalyst derived from a 8 -amino alcohol gave high enantioselectivities ( $92 \%$ ee) in the intermolecular MBH reaction, whereas the same chiral ligand afforded the corresponding product in high yield ( $85 \%$ ) with moderate enantioselectivity ( $75 \% \mathrm{ee}$ ) in the intramolecular MBH reaction. The use of a thiophene ring-containing thiourea derivative gave high enantioselectivities in the intermolecular and intramolecular MBH reactions ( $85 \%$ and $95 \%$ ee, respectively).

Keyword: Intermolecular Morita-Baylis-Hillman reaction, intramolecular Morita-Baylis-Hillman reaction reaction; 8 -amino alcohol; chiral thiourea derivatives

## Introduction

The Morita-Baylis-Hillman (MBH) reaction is one of the most important methods for forming C-C bonds ${ }^{1-3}$. It involves the coupling of electron-deficient alkenes with $\mathrm{sp}^{2}$ hybridised carbon electrophiles, such as aldehydes, ketones and aldimines and is catalysed by nucleophilic amines or phosphines. ${ }^{4}$ Various activated alkenes such as enals, ${ }^{5,6}$ enones, ${ }^{7-9}$ acrylates ${ }^{10,11}$ and acrylamides ${ }^{12,13}$ have been successfully used in the MBH reaction.

Morita ${ }^{14}$ described a novel reaction between various aldehydes and acrylic compounds catalysed by a tertiary phosphine (tricyclohexylphosphine) and yielding vinylic compounds. Subsequently, in 1972, Baylis and Hillman ${ }^{15}$ reported a similar reaction between acetaldehyde and ethyl acrylate or acrylonitrile. Instead of phosphines, they used 1,4- diazabicyclo[2.2.2]octane (DABCO) as a Lewis base to obtain products similar to those of Morita's study (Scheme 1).

Scheme 1. The Morita-Baylis-Hillman reaction.

Since then, various chiral catalysts such as chiral Lewis acid or Brønsted-Lowry acid catalysts, ${ }^{16-18}$ chiral amino- or phosphino-type catalysts, ${ }^{19-21}$ chiral amino acid derivatives, ${ }^{22,23}$ a chiral thiourea-type catalyst ${ }^{24}$ and chiral ionic liquids ${ }^{25}$ have been reported for this asymmetric catalytic process. These chiral catalysts have been developed for intermolecular MBH reactions. ${ }^{26}$ Optically active $\beta$-hydroxy- $\alpha$-methylene carbonyl compounds are useful intermediates in natural product synthesis.

To synthesise these compounds, several enantioselective versions of the MBH reaction involving a chiral catalyst have been reported. ${ }^{27}$ Barrett et al. ${ }^{28}$ used chiral bicyclic pyrrolizidine derivatives (A) as asymmetric catalysts for the MBH reaction of ethyl vinyl ketone and an aromatic aldehyde. Hatakeyama et al. ${ }^{29}$ used 8 -isocupreidine ( $\mathbf{B}$ ) to catalyse the asymmetric MBH reaction between aldehydes and the strongly activated Michael acceptor $1,1,1,3,3,3$-hexa-fluoroisopropyl acrylate (HFIP). Hayashi et al. ${ }^{30}$ developed chiral diamines (C) as catalysts for the MBH reaction of MVK and electron-deficient benzaldehyde, affording adducts with enantioselectivities up to $75 \%$ (Scheme 2).

Chiral thiourea derivatives such as amino alcohol-derived thiourea and bifunctional phosphinothiourea have been used successfully for the intermolecular MBH reaction. ${ }^{31-33}$ In the presence of $L$-valine-derived phosphinothiourea (D), the MBH products were obtained in good enantioselectivities (up to $83 \%$ ee) (Scheme 2). ${ }^{34}$ The intramolecular MBH reaction can be performed when suitably oriented electrophilic and activated alkene moieties are present in the same molecule, but few examples of intramolecular MBH reactions are found in the literature.

In 1992, Franter and co-workers reported the first asymmetric intramolecular MBH reaction using pchiral phosphine (-)-CAMP to catalyse cyclisation of an enoate onto a ketone to afford cyclopenten-ol ester in $14 \%$ ee. ${ }^{35-37}$

Pipecolinic acid (E) and N-methylimidazole were used by Miller as a cocatalytic system to catalyse an intermolecular MBH reaction (84 \% ee). ${ }^{38}$ (Scheme 3).

Wu et al. ${ }^{39}$ developed chiral cyclohexane-based (F) and amino acid-derived phosphinothioureas as catalysts for the enantioselective intramolecular MBH reaction of $\omega$-formyl- $\alpha, \beta$-unsaturated carbonyl compounds with up to $98 \%$ and $84 \%$ ee, respectively (Scheme 3). Honh et al. ${ }^{40}$ reported the proline-catalysed intermolecular MBH reactions of hept-2-enedial and the corresponding products were obtained in high enantiomeric excess ( $98 \% \mathrm{ee}$ ) and good yield ( $74 \%$ ). Gladysz et al. ${ }^{41}$ reported an intramolecular MBH reaction
in the presence of rhenium-containing phosphine $\left(\eta^{5}-\mathrm{C}_{5} \mathrm{H}_{5}\right) \operatorname{Re}(\mathrm{NO})\left(\mathrm{PPh}_{3}\right)\left(\mathrm{CH}_{2} \mathrm{PAr}_{2}\right)$, affording the product in 74 \% ee.

In this study, the intermolecular MBH reaction of an aromatic aldehyde with methyl vinyl ketone (MVK) and the intramolecular MBH reaction of $\omega$-formyl-enone catalysed by the thioureas 7a-d and 11a-d are presented.

## Results and Discussion

The synthesis of chiral thiourea derivatives 7a-d. The synthesis of $\beta$-amino alcohol 6 from (1S)-(-)-camphor was performed according to the literature procedure. ${ }^{42,43}$ Chiral amino alcohol-based thioureas 7a-d were easily obtained by condensation of $\beta$-amino alcohol 6 with 1.1 equiv. of the corresponding isothiocyanate in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at room temperature (Scheme 4).

Chiral diamine 10 was prepared in a two-step reaction involving condensation of ( $1 S, 2 S$ )-1,2-diphenylethane-1,2-diamine 9 with 1 equiv. of 5-methyl thiophene-2-carbaldehyde 8, followed by reduction with $\mathrm{LiAlH}_{4}$.

For the synthesis of $\mathbf{7 a - d}$ and $11 \mathrm{a}-\mathrm{d}$, chiral compounds $\mathbf{6}$ and $\mathbf{1 0}$ were stirred with 1.1 equiv. of the corresponding isothiocyanates at room temperature (Scheme 4).

Scheme 4. Synthetic route of the chiral thiourea derivatives.

The enantioselective MBH reaction of p-nitrobenzaldehyde with methyl vinyl ketone (MVK)
To determine the best catalyst, the model reaction of $p$-nitrobenzaldehyde and MVK was initially performed in the presence of $10 \mathrm{~mol} \%$ of catalysts $\mathbf{7}$ and 11a-d, and the results are summarised in Table 1, (Scheme 5) .

Scheme 5. Enantioselective intermolecular MBH reaction.

Chiral ligand screening showed that $\beta$-amino alcohol-based thiourea 7a provided the corresponding product in high chemical yield ( $80 \%$ ) with $60 \%$ ee. The use of $\mathbf{7 b}$ as a chiral ligand-bearing strong electronwithdrawing substituent on the phenyl group afforded MBH adduct 3a in $78 \%$ yield with $80 \%$ ee. In the presence of $\mathbf{7 c}$ or $\mathbf{7 d}$ as the chiral ligand, the corresponding MBH product 3a was obtained in $75 \%$ chemical yield with 70 \% ee and 78 \% chemical yield with $65 \%$ ee, respectively (Table 1, entries 3, 4). In the presence 11a-d, good enantioselectivities and chemical yields were obtained (Table 1, entries 5-8). Performing the MBH reaction with 11a gave the corresponding product in $78 \%$ yield with $72 \%$ ee. The use of 11b as the chiral ligand afforded the corresponding product in $77 \%$ yield with $74 \%$ ee.

${ }^{\text {a }}$ The reaction were performed using 10 mol $\%$ of chiral ligand, 5 equiv
of MVK in 1 mL solvent at room temperature. ${ }^{\text {b }}$ Isolated yields.
${ }^{c}$ Determined by HPLC using Chiral OD-H column

The enantioselectivity decreased with an increase in the reaction time from 30 to 60 min . In the presence of 7 a , a higher conversion ( $85 \%$ yield) was obtained after 60 min , but the enantioselectivity decreased ( $72 \%$ ee) (entry 11). The MBH product after 45 min was obtained in $78 \%$ chemical yield with $92 \%$
ee. The absolute configuration of the intermolecular MBH products, $R$, was assigned by comparing the retention time (chiral HPLC) with its literature values. ${ }^{23,30,31,33,48}$

Because 7a gave the highest enantioselectivity in the MBH reaction of $p$-nitrobenzaldehyde with MVK, it was identified as most effective among the chiral ligand series (Table 1, entry 10) and was selected for optimising further the reaction conditions.

Then, the solvent effect on the MBH reaction of $p$-nitrobenzaldehyde with MVK was investigated using 7a as the chiral ligand. The results, outlined in Table 2, show that the highest enantiomeric excess ( 92 \%) was observed in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. In polar solvents such as $\mathrm{EtOH}, \mathrm{DMF}$ and MeCN , the MBH adduct 3a was obtained in low yield and ee (Table 2, entries 5-7). The lowest enantioselectivity was obtained in DMSO. Increasing the reaction temperature from room temperature to $40^{\circ} \mathrm{C}$ decreased the ee value to $77 \%$ (Table 2, entries 4,9 ), whereas decreasing the reaction temperature to $-15^{\circ} \mathrm{C}$ obtained the corresponding product in $45 \%$ yield with $65 \%$ ee(Table 2, entry 10).

${ }^{\mathrm{c}}$ Determined by HPLC using Chiral OD-H column.
To investigate the effect of electron-withdrawing and electron-donating substituents, the asymmetric MBH reaction was performed with different aromatic aldehydes using conditions optimised for ligand 7a (10 mol\% of 7 a catalyst, 5 equiv. of $\mathrm{MVK}, \mathrm{CH}_{2} \mathrm{Cl}_{2}$ as a solvent, room temperature). The results are summarised in Table 3. The electronic effects on the aromatic ring of the aldehyde affected the reactivity and selectivity.

Electron-withdrawing substituents gave higher enantioselectivities than did electron-donating substituents. It is known that the electrophilicity of the carbonyl carbon atom in aryl aldehydes is increased by electronwithdrawing groups and decreased by electron-donating groups; therefore, the substrates with an electronwithdrawing substituent are expected to afford a faster reaction, leading to higher enantioselectivity. In fact, a lower enantioselectivity was observed for the meta-substituted benzaldehyde compared to that of its relevant para-substituted analogue (entry 3 and 4). With ligand 7a, the lowest enantiomeric excesses were observed for aromatic aldehydes bearing ortho substituents, probably due to the ortho effects (entry 2 and 7 ). In the presence of ligand 7 a , the non-substituted benzaldehyde afforded the product with $85 \%$ ee but in low yield ( $62 \%$ ). The yields and ee values decreased ( $62 \%$ yield, $55 \%$ ee) when the methoxy group on the phenyl ring was at the para position(entries 10).

[^0]The enantioselective intramolecular MBH reaction of $\omega$-formyl-enone catalyzed by $\beta$-amino alcohol-based thiourea 7 and 11a-d

Scheme 6. Enantioselective intramolecular MBH reaction.
${ }^{\oplus}$ AUTHOR(S)

Chiral thiourea derivatives $\mathbf{7}$ and 11a-d were examined in the enantioselective intramolecular MBH reaction of $\omega$-formyl-enone as the model substrate (Scheme 6). $\beta$-Amino alcohol-based thioureas 7 a were used as catalysts in the intramolecular reaction of substrate $12 a$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at room temperature, and the MBH product 13a was obtained in $65 \%$ chemical yield with good enantioselectivity ( $72 \%$ ee). As shown in Table 4, the structure of the chiral ligands significantly affected the enantioselectivity and the chemical yield. The thiourea moiety of the chiral ligands played an important role in obtaining a high yield and enantioselectivity. Chiral thiourea derivatives $\mathbf{7 b}$ and $\mathbf{1 1 b}$, bearing strong electron-withdrawing substituents at the phenyl ring, afforded the corresponding product in 63 \% chemical yield with $95 \%$ ee and in $65 \%$ chemical yield with $94 \%$ ee, respectively. Chiral ligand 7b provided the corresponding product in higher enantioselectivity and chemical yield than ligands $\mathbf{7 a}, \mathbf{c}, \mathbf{d}$ did (Table 4, entries 1-4). These observations were agreement with the observations of Wu et $a l .{ }^{39}$ The absolute configuration of the intramolecular MBH products is $R$-configuration, which was assigned by comparing the retention time (chiral HPLC) with those reported in the literatures. ${ }^{30,39,41,48,46}$

Because 7b gave the highest enantioselectivity in the intramolecular MBH reaction, it was identified as most effective among the chiral ligand series (Table 4, entry 2) and was selected for optimising further the reaction conditions.

To further improve the enantioselectivity of $\mathbf{1 2 a}$, the effect of solvent on the enantioselective intramolecular MBH reaction of $\omega$-formyl-enone was investigated (Table 5, entries 1-8). The enantioselective intramolecular MBH reaction was performed in solvents such as n-hexane, toluene, $\mathrm{CHCl}_{3}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, \mathrm{THF}$, acetone, $\mathrm{CH}_{3} \mathrm{CN}, \mathrm{DMF}, \mathrm{MeOH}$ and EtOH . Table 5 shows that $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was the most appropriate solvent (entry 4). In DMF, the corresponding product was obtained in $10 \%$ chemical yield with $25 \%$ ee (entry8). In MeOH, the

MBH product 13a was obtained in moderate chemical yield (72 \%) but with poor enantioselectivity (12 \% ee) (entry 9).

The enantioselective intramolecular MBH reaction involving various $\omega$-formyl-enone substrates was investigated, and the results are summarised in Table 6. All the substituted aromatic enones were converted to the MBH reaction product in 62-95 \% ee. As shown in Table 6, the substrates with an electron-withdrawing substituent at the para position of the phenyl ring afforded higher enantioselectivity than those with an electron-donating substituent or without a phenyl substituent.

With a substrate-bearing substituent at the ortho position of the phenyl group, the corresponding product was obtained in excellent yield with poor enantioselectivity, due to the ortho effect (entries 2 and 8 ).

Table 6. The enantioselective intramolecular MBH reaction involving various $\omega$-formyl-enone substrates ${ }^{\text {a }}$

## Conclusions

In summary, we have developed the MBH reaction of an aromatic aldehyde with MVK and the intramolecular MBH reaction of $\omega$-formyl-enone catalysed by thioureas 7a-d and 11a-d. The reaction proceeds under very mild conditions to quickly afford the desired product in good to excellent yields with generally excellent enantiomeric excesses. The use of $(1 R, 2 S)-7 b$ as a chiral ligand bearing a strong electron-withdrawing substituent at the phenyl group afforded the hydroxyl enone with low enantioselectivity ( $40 \%$ ee) in the intermolecular MBH reaction, whereas the same ligand gave the highest enantioselectivity ( $97 \% \mathrm{ee}$ ) in the intramolecular MBH reaction. Thiophene ring-containing thiourea derivatives bearing a strong electronwithdrawing substituent on the phenyl group 11b gave a high enantioselectivity in the intermolecular MBH reaction ( $85 \%$ ee), whereas the same ligand afforded the cyclic hydroxyl enones with excellent enantioselectivity ( $94 \%$ ee). The application of these ligands to the other asymmetric reactions is now under investigation.

## Experimental Section

General. Reagents and solvents were purchased from Aldrich, Merck and Fluka. All solvents were dried before use according to the standard procedures. All reactions were carried out under Ar atmosphere and monitored
by thin-layer chromatography (TLC) on Merck silica gel plates ( $60 \mathrm{~F}-254$ ) using UV light or phosphomolybdic acid in methanol. E. Merck silica gel ( 60 , particle size $0.040-0.063 \mathrm{~mm}$ ) was used for flash chromatography. All NMR spectra were recorded on a Bruker DPX- 400 MHz spectrometer at room temperature. Chemical shifts (parts per million) are reported relative to TMS. Coupling constant are expressed as J values in Hertz. Thin layer chromatography (TLC) was performed using Merck Kieselgel 60 F254. Elemental analyses (C, H, N, S) were carried out on a Carlo Erba Model Thermo Scıentıfıc Flash 2000 elemental analyzer. Optical rotations were recorded on a Autopol IV polarimeter. All melting points were measured with an Electrothermal melting point instrument. Elemental analyses were carried out on a LECO CHNS-932 series analyzer. Enantiomeric excesses were determined by HPLC analysis using a Shimadzu and Thermo Finnigan analyzer.

Synthesis of chiral catalysts 7a-d. Camphor was converted to 3-hydroxyimino-2-oxo-1,7,7trimethylbicyclo[2.2.1]heptane $\mathbf{5}$ using ter-butyl nitrite dry THF in the presence of ter-sodium butylate ${ }^{42,43}$. 3-Amino-2-hydroxy-1,7,7-trimethylbicyclo[2.2.1]heptane 6 was obtained from the reduction of 5 with $\mathrm{LiAlH}_{4}$ by refluxing in dry ether with $79 \%$ yield, according to literature procedure. ${ }^{42-45}$
$\beta$-Amino alcohol $6(1.0 \mathrm{mmol})$ was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2.0 \mathrm{~mL})$ was added the corresponding solution of isothiocyanate ( 1.1 mmol ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2.0 \mathrm{~mL})$ at the room temperature. The reaction mixture was allowed to stir at same temperature until reaction completed (monitoring by TLC). The solvent removed under reduced pressure and the the residue was purified by column chromatography (petroleum ether/ethyl acetate).

Synthesis of chiral diamine 10. According to our previously procedure, ${ }^{46,47}$ the formylation of 2-methyl thiophene was performed according to Vismeier Haack method.
5-Methyl thiophene-2-carbaldehyde $\mathbf{8}(5 \mathrm{mmol})$ were dissolved in 10 mL benzene to which was added ( $1 \mathrm{~S}, 2 \mathrm{~S}$ )-1,2-diphenylethane-1,2-diamine ( 5 mmol ) under nitrogen atmosphere. The mixture was refluxed for 4 h and water was removed in a Dean-Stark trap. Reaction was controlled by TLC. Imine was concentrated to dryness without purification. The synthesized imine was dissolved in $15 \mathrm{~mL} \mathrm{Et}_{2} \mathrm{O}$ and added to a suspension of 1.40 $\mathrm{mmol}_{\mathrm{LiAlH}_{4} \text { in } 10 \mathrm{~mL} \mathrm{Et}}^{2} \mathrm{O}$. The mixture was refluxed for 8 h and controlled by TLC. When the reaction was completed, the mixture was cooled to room temperature and quenched with 15 mL water. It was extracted with ether ( $3 \times 10 \mathrm{~mL}$ ) and dried over $\mathrm{MgSO}_{4}$. The mixture was filtered and the solvent was evaporated. Crude product 10 were purified by flash column chromatography(EtOAc-hexane, 1:1)
(1S,2S)-N-((5-Methylthiophen-2-yl)methyl)-1,2-diphenylethane-1,2-diamine (10). Brown oil, 80\% yield; $R_{f}: 0.15$ (EtOAc:hexane, 1:1); $[\alpha]_{D}^{25}=-1.41\left(c=0.38, \mathrm{CHCl}_{3}\right) ;{ }^{1} \mathrm{H}$ NMR: $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) \delta 2.30(\mathrm{~s}, 3 \mathrm{H}), 3.86(\mathrm{~d}, 1 \mathrm{H}$, $J 14.4 \mathrm{~Hz}, 1 \mathrm{H}), 3.91(\mathrm{~d}, 1 \mathrm{H}, J 14.4 \mathrm{~Hz}, 1 \mathrm{H}), 4.53(\mathrm{~d}, J 4.5,1 \mathrm{H}), 4.55(\mathrm{~d}, \mathrm{~J} 4.51 \mathrm{H}$, ), $6.59(\mathrm{~d}, J 3.6 \mathrm{~Hz}, 1 \mathrm{H}), 6.74(\mathrm{~d}, \mathrm{~J}$ $3.60 \mathrm{~Hz}, 1 \mathrm{H}), 7.156-7.33(\mathrm{~m}, 10 \mathrm{H}, \mathrm{ArH}), 7.86(\mathrm{~s}, 2 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $\left.\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right) \delta 15.72,48.23,60.74,67.08$, 105.97, 108.06, 126.9, 127.02, 128.1, 128.5, 128.8, 138.52, 143.76. Anal. Calcd. for $\mathrm{C}_{20} \mathrm{H}_{22} \mathrm{~N}_{2} \mathrm{~S} \mathrm{C}, 74.49 ; \mathrm{H}, 6.88$; N, 8.69; S, 9.94; found: C, 74.52; H, 6.85; N, 8.70; S, 9.93.
Synthesis of thiourea derivatives (11a-d). To solution of chiral compound $\mathbf{1 0}(1.0 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2.0 \mathrm{~mL})$ was added the corresponding solution of isothiocyanate ( 1.1 mmol ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2.0 \mathrm{~mL})$ at room temperature and reaction mixture was allowed to stir at same temperature until reaction completed (monitoring by TLC). The solvent removed under reduced pressure and the the residue was purified by column chromatography (petroleum ether/ethyl acetate).

Enantioselective intramoleculer Morita-Baylis-Hillman reaction. To a solution of chiral thiourea derivative ( 0.02 mmol , in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1.0 \mathrm{~mL})$ was added substrates $8(0.2 \mathrm{mmol})$ at room temperature. The reaction mixture was stirred at room temperature until the reaction completed (monitoring by TLC). The solvent was removed under reduced pressure and the residue was purified by a flash column chromatography to afford the intramolecular Baylis-Hillman adducts. Compounds 13a-k are known compounds; they were characterized by comparing their ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}$ NMR spectra with those published in the literature ${ }^{18,19,21,25}$. The ee values were determined by HPLC analysis with a chiral column. ${ }^{30,41,46,48}$
