IV. Electrochemical studies of 11 and 12 compounds

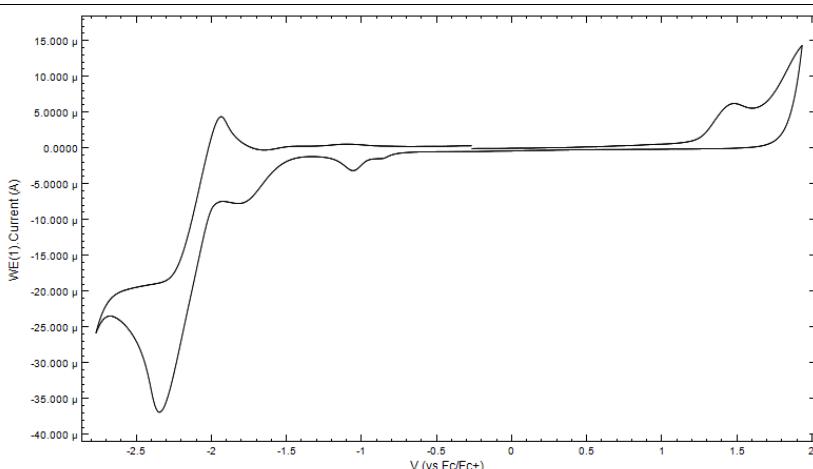

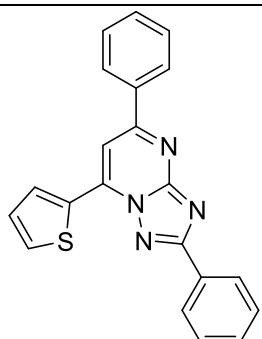

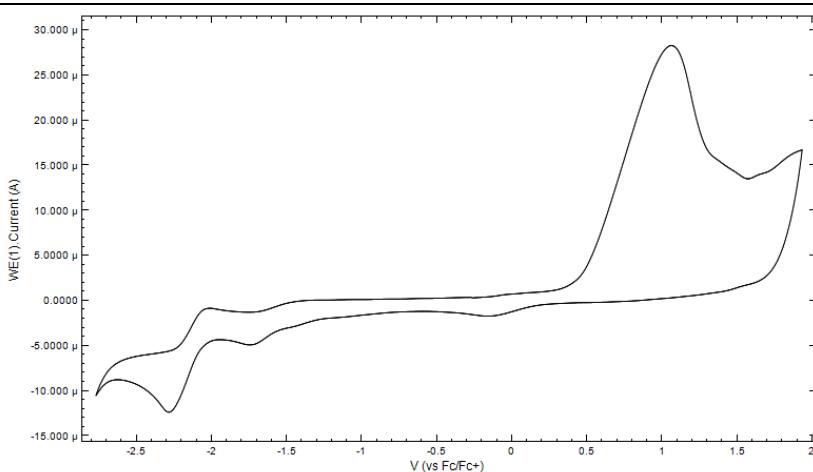

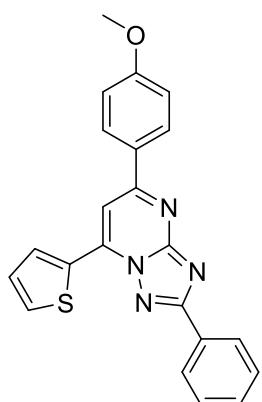

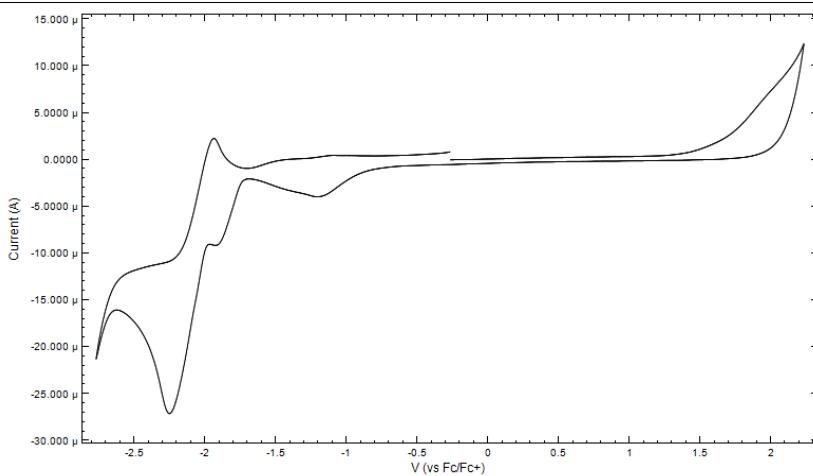

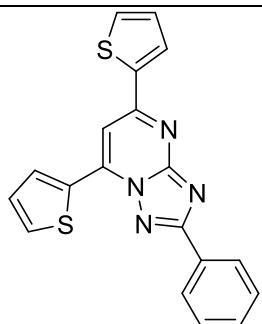

The HOMO energy levels (E_{HOMO}) were estimated from $E_{\text{ox}}^{\text{onset}}$ of the first oxidation peaks by the empirical equation: $E_{\text{HOMO}} = -[E_{[\text{onset,ox vs.Fc/Fc+}]} + 5.10]$. The LUMO energy levels (E_{LUMO}) were estimated from $E_{\text{red}}^{\text{onset}}$ of the first reduction peaks by the empirical equation: $E_{\text{LUMO}} = -[E_{[\text{onset,red vs.Fc/Fc+}]} + 5.10]$. We have used +5.10 eV value in the Fermi scale for the formal potential of the Fc/Fc⁺ redox couple instead of +4.80 eV in accordance with a recent discussion of Bazan et al.¹ Energy gaps (E_{gap}) were calculated by the following equation: $E_{\text{gap}} = E_{\text{LUMO}} - E_{\text{HOMO}}$.
